

# Technical Memorandum 33: Aquatic Resource Delineation Report

---

in support of the  
Environmental Impact Statement

## West Davis Corridor Project

Federal Highway Administration  
Utah Department of Transportation

UDOT Project No. S-0067(14)0

Prepared by  
HDR Engineering, Inc.  
2825 East Cottonwood Parkway, Suite 200  
Salt Lake City, UT 84121

**Revised July 2017**

## Executive Summary

On behalf of the Utah Department of Transportation, HDR Engineering, Inc. has prepared this aquatic resource delineation report in support of a proposed roadway project in western Davis and Weber Counties known as the West Davis Corridor Project. HDR and other members of the West Davis Corridor Project team conducted fieldwork for the delineation in 2012, 2013, 2016, and 2017. The delineation was completed in accordance with the U.S. Army Corps of Engineers *Wetland Delineation Manual, Technical Report Y-87-1* (USACE 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, version 2* (USACE 2008), and U.S. Army Corps of Engineers *Regulatory Guidance Letters* and joint agency regulations, policies, and guidance.

The entire delineation survey area is about 4,416 acres and contains a total of 793.50 acres of aquatic resources. These resources consist of 196 wetlands (emergent marsh, wet meadow, and playa) that total 732.65 acres. Wetlands in the survey area provide important habitats for wildlife, especially migratory birds, and also provide water quality and hydrology functions. A separate report, West Davis Corridor Wetland Functional Assessment Report, describes methods and results of the functional assessment conducted for the delineated wetlands. The survey area also contains 10,966 linear feet (3.81 acres) of perennial and intermittent stream channels, 40.80 acres of open water ponds, and 58,076 linear feet (16.24 acres) of open channel canals and ditches/drainages.

WOUS	Waters of the United States

## 2.0 Introduction

On behalf of the Utah Department of Transportation (UDOT), HDR Engineering, Inc. (HDR) has prepared this aquatic resource delineation report in support of a proposed roadway project in western Davis and Weber Counties known as the West Davis Corridor (WDC) Project. The purpose of the delineation is to identify wetlands and other aquatic resources within the delineation survey area (survey area; see Figure 1) for the WDC Project. A separate report, West Davis Corridor Wetland Functional Assessment Report, describes methods and results of the functional assessment conducted for the delineated wetlands.

UDOT proposes to construct the new road in an area that supports wetlands and other aquatic resources, such as streams, that are subject to regulation under the Clean Water Act (CWA; 33 United States Code [USC] 1344). The purpose of this technical memorandum is to delineate, describe, and map the presence and extent of aquatic resources in the survey area. The results of the delineation are preliminary until verified by the U.S. Army Corps of Engineers (USACE).

### What are Aquatic Resources?

Aquatic resources are areas that satisfy criteria prescribed by USACE delineation procedures and guidance (see Section 3.0) and include wetlands, streams and other waterways, playas/mudflats, and open water ponds, lakes, and reservoirs.

As described in Section 2.0, not all aquatic resources are subject to regulation under the Clean Water Act.

## 2.1 Delineation Survey Area Description

The survey area is about 4,416 acres and extends northward from the Farmington–Centerville city boundary to 1800 North in West Point, Utah. It includes the sections listed below in Table 2-1 that are shown on the U.S. Geological Survey 7.5-Minute Series Quadrangle Topographic maps for Farmington, Kaysville, Clearfield, and Roy. A vicinity map showing the project location is included as Figure 1.

**Table 2-1. Survey Area Public Land Survey System Sections**

### 2.1.1 Directions to the Survey Area

The survey area is accessible from Interstate 15 (I-15) from exits in Farmington, Kaysville, Layton, Syracuse, and Clearfield. The interior parts of the survey area are accessible by local arterial and residential roads. The survey area is shown in Figure 1 which includes a map sheet index corresponding to the delineation map series in Appendix A.

## 2.2 Contact Information for the Applicant and Owner

The applicant and owner for this project are the same agency:

Utah Department of Transportation (UDOT) Region 1  
166 W. Southwell Street  
Ogden, Utah 84404-4194

Attention: Randy Jefferies, Project Manager  
rjefferies@utah.gov  
(801) 791-1059

Land in the survey area is owned by multiple public and private entities. Contact and access information for landowners can be coordinated as necessary.

## 2.3 Contact Information for the Wetland Delineation Consultants

The delineation was performed by:

HDR Engineering, Inc.  
2825 East Cottonwood Parkway, Suite  
200  
Salt Lake City, Utah 84121

General questions can be directed to  
Vince Izzo at (406) 396-6223 or  
Vincent.Izzo@hdrinc.com.

**Wetland Coordinator:** Mike Perkins,  
(801) 743-7864  
Michael.Perkins@hdrinc.com

**Field Biologists:** Amy Croft,  
Donovan Gross, Maggie Nichols,  
Jared Wilkinson, Trent Toler, Ron  
Kass, PhD, Nate Nichols, Paul  
Dawson, Brian Nicholson

## 3.0 Regulatory Setting

As described in Section 328 of Chapter 33 in the Code of Federal Regulations (CFR), the objective of the CWA is to maintain and restore the chemical, physical, and biological integrity of the waters of the United States (33 CFR Part 328 Section 328.4). Any person, firm, or agency planning to alter or work in waters of the United States (WOUS), including discharging dredged or fill material, must first obtain authorization from USACE under Section 404 of the Clean Water Act and, if applicable, Section 10 of the Rivers and Harbors Act of 1899 (33 USC 403) for work within navigable WOUS. Permits, licenses, variances, or similar authorization might also be required by other federal, state, and local statutes. The following sections describe the regulatory framework that could apply to areas within the delineation survey boundary area that are potentially subject to federal and state jurisdiction.

### 3.1 Section 404 of the Clean Water Act

*Waters of the U.S.* is the encompassing term for areas that qualify for federal regulation under Section 404 of the CWA. Section 404 of the CWA gives the U.S. Environmental Protection Agency (EPA) and USACE regulatory and permitting authority regarding discharging dredged or fill material into “navigable waters of the United States.” Section 502(7) of the CWA defines *navigable waters* as “waters of the United States, including territorial seas.”

33 CFR 328 defines the term *waters of the United States* as it applies to the jurisdictional limits of the authority of the USACE under the CWA. A summary of this definition of WOUS in 33 CFR 328.3 includes (1) waters used for commerce and subject to tides; (2) interstate waters and wetlands; (3) “other waters” such as intrastate lakes, rivers, streams, and wetlands; (4) impoundments of waters; (5) tributaries of waters; (6) territorial seas; and (7) wetlands adjacent to waters. Therefore, for purposes of determining USACE jurisdiction under the CWA, *navigable waters* as defined in the CWA are the same as WOUS, defined in the CFR above. WOUS include non-isolated “wetlands” and “other WOUS”.

Other WOUS refer to unvegetated waterways and other water bodies with a defined bed and bank, such as drainages, creeks, rivers, and lakes. This approximately translates to the bank-to-bank portion of water bodies, up to the ordinary high-water mark (OHWM). “Other waters” typically lack hydrophytic vegetation and might also lack hydric soils. Jurisdiction in non-tidal areas extends to the OHWM, which is defined as:

... that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the characteristics of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas. [33 CFR 328.3(e); also 51 Federal Register (FR) 41250, November 13, 1986, as amended at 58 FR 45036, August 25, 1993]

Wetlands are defined as:

... those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. [33 CFR 328.3(b); 40 CFR 230.3(t)].

The guidelines for implementing Section 404 of the CWA are referred to as the Section 404(b)(1) Guidelines and were developed by EPA in conjunction with USACE (40 CFR 230). The Guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

On June 29, 2015, the EPA and the USACE jointly published the *Clean Water Rule: Definition of “Waters of the United States”* (Clean Water Rule) and it became effective August 28, 2015 (40 CFR 230.3). The rule interprets two key Supreme Court decisions, often referred to as *Rapanos* and *SWANCC*. *Rapanos* is the 2006 Supreme Court decision in the consolidated cases of *Rapanos v. United States* and *Carabell v. United States Army Corps of*

Engineers, 547 UW 715 (2006); SWANCC is the 2001 Supreme Court decision in *Solid Waste Agency of Northern Cook County v. Army Corps of Engineers*, 531 U.S. 159 (2001). The Clean Water Rule addresses both wetlands and waterbodies and is limited to whether CWA applies, superseding prior 1986 regulations and applicable guidance. However, a nationwide stay was issued by the U.S. Court of Appeals for the 6<sup>th</sup> Circuit on October 9, 2015, which blocked the implementation of the Clean Water Rule. In the meantime, the USACE is not implementing the Clean Water Rule, and is using the 1986 regulations and applicable guidance (those in effect prior to August 28, 2015) in making jurisdictional determinations or taking other actions based on the definition of WOUS.

### 3.1.1 Significant Nexus of Tributaries

The USACE and the EPA issued joint guidance December 2, 2008 on implementing the June 19, 2006 U.S. Supreme Court opinions resulting from *Rapanos v. United States* and *Carabell v. United States* (*Rapanos*) cases (USACE 2008a). This guidance states that the agencies will assert jurisdiction over (1) traditional navigable waters (TNW), (2) wetlands adjacent to TNW, (3) non-navigable tributaries of TNW that are relatively permanent where the tributaries typically flow year around or have continuous flow at least seasonally (e.g., typically three months), and (4) wetlands that abut such tributaries. A “significant nexus” determination will be made for non-navigable tributaries that are not relatively permanent and their adjacent wetlands. Such features that are determined to have a “significant nexus” to a TNW will also be subject to CWA jurisdiction. A significant nexus requires that there be “more than an insubstantial or speculative effect on the chemical, physical, and/or biological integrity of a TNW”. This guidance also states the following features will generally not be subject to CWA jurisdiction: swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches (including roadside ditches) excavated wholly in and draining only uplands and that do not carry a relatively permanent flow of water.

### 3.1.2 Isolated Areas Excluded from Section 404 Jurisdiction

Some wetlands and other aquatic resources might also be considered outside of USACE jurisdiction as a result of the Supreme Court’s decision in *Solid Waste Agency of Northern Cook County (SWANCC) v. United States Army Corps of Engineers* (531 U.S. 159 [2001]). Isolated aquatic resources are those areas that do not have a surface or groundwater connection other significant nexus to, and are not adjacent to, a navigable “water of the U.S.” and do not otherwise exhibit an interstate commerce connection.

## 3.2 Fish and Wildlife Coordination Act

Under the Fish and Wildlife Coordination Act (16 USC 661–666), project proponents are required to consult with the U.S. Fish and Wildlife Service (USFWS) and the appropriate state wildlife agency for any federal project in which the waters of any stream or other body of water would be impounded, diverted, deepened, or otherwise modified. These agencies prepare reports and recommendations that document the expected effects of the project on

wildlife and identify measures that could be adopted to prevent loss or damage to wildlife resources. The term *wildlife* includes both animals and plants. The provisions of the Fish and Wildlife Coordination Act are implemented through the National Environmental Policy Act (NEPA) process and the Section 404 permit process.

### **3.3 Executive Order 11990 for the Protection of Wetlands**

Executive Order 11990 for the Protection of Wetlands (May 24, 1977) establishes a national policy to avoid adverse impacts on wetlands whenever there is a practicable alternative. On federally funded projects, impacts on wetlands must be identified in the environmental document. Alternatives that avoid wetlands must be considered. If wetland impacts cannot be avoided, then all practicable measures to minimize harm must be included. This must be documented in a specific “Wetlands Only Practicable Alternative Finding” in the final environmental document. An additional requirement is to provide early public involvement in projects affecting wetlands.

The Federal Highway Administration (FHWA) provides technical assistance in meeting these criteria (FHWA Technical Advisory 6640.8A) and reviews environmental documents for compliance.

### **3.4 Section 401 of the Clean Water Act**

Section 401 of the CWA requires state certification for any permit or license issued by a federal agency for an activity that could result in a discharge of dredged or fill material into WOUS. This requirement allows each State to have input into federally approved projects that could affect its waters (rivers, streams, lakes, and wetlands) and to ensure the projects will comply with state water quality standards and any other water quality requirements of state law. Any Section 401 certification in Utah also ensures that the project will not adversely affect impaired waters (waters that do not meet water quality standards) and that the project complies with applicable water quality improvement plans.

### **3.5 Utah Stream Alteration Program**

Section 73-3-29 of the Utah Code requires any person, governmental agency, or other organization wishing to alter the bed or banks of a natural stream to obtain written authorization from the State Engineer prior to beginning work. Natural streams are considered any natural waterway that receives enough water to develop an ecosystem that differs from the surrounding upland environment. Although it cannot be applied to permit wetland impacts, USACE Programmatic General Permit 10 allows an applicant to obtain both state approval and authorization under CWA 404 of through a single application process.

## **4.0 Delineation Methodology**

### **4.1 Preliminary Data Gathering and Synthesis**

Prior to conducting delineation fieldwork, the delineation team reviewed information from multiple sources. To help develop a background knowledge of the physical features in the survey area, the team reviewed data and referenced maps of potential wetland areas collected from previous WDC wetland and wildlife fieldwork that was conducted in 2010 and 2011. The team also obtained information related to topography, drainage, soils, water features, and documented wetlands. Additional information sources included:

- Aerial photographs of the survey area and surrounding areas from 2011, 2012, 2013, 2016 and prior years in some cases
- USFWS National Wetland Inventory (NWI) maps (see Appendix E)
- USACE delineation manuals and delineation reference guides (described below in Section 3.3)
- Soil Survey of Davis-Weber Area, Utah (NRCS 1968)
- National Hydric Soils List for Utah (NRCS 2016a)
- Natural Resources Conservation Service's (NRCS) web soil survey (NRCS 2017; see Appendix G)

### **4.2 Delineation Boundaries**

All areas within the approximately 4,416-acre survey area were included in the delineation.

### **4.3 Delineation Procedures**

The delineation team conducted fieldwork for the delineation between May 2 and September 26, 2012, between April 24 and June 26, 2013, between July 18, 2016 and September 28, 2016, and between May 12 and June 1, 2017. During and following periods of delineation fieldwork, the delineation team coordinated with UDOT wetland specialists and USACE. The UDOT wetland program manager participated in fieldwork during several days in 2012 and 2013. On October 3, 2012, the project team conducted a field review meeting of several wetland areas with representatives from USACE, EPA, and UDOT. Although this field review meeting did not constitute a formal review of delineated wetlands, the delineation team incorporated guidance from this meeting to make revisions to work previously completed and it was used to help guide subsequent field investigations. Particular coordination items are described in corresponding subsections for delineation procedures and existing conditions (Section 4.0).

Based on coordination with UDOT and USACE, delineation fieldwork in 2016 included review by visual inspection and follow-up investigations as needed of wetlands delineated in

2012 and 2013, and delineation of new survey areas that encompassed potential compensatory mitigation sites. Some areas in which delineation fieldwork was conducted in 2012 have been excluded from the current survey area because they are no longer being considered among potential WDC alignment options. In May and July of 2017, the USACE reviewed delineation information and conducted field reviews. Follow-up investigations in 2017 focused on interest areas provided by the USACE from reviewing delineation data to date.

The delineation was conducted in accordance with the USACE *Wetland Delineation Manual, Technical Report Y-87-1* (USACE 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, version 2* (USACE 2008), and USACE *Regulatory Guidance Letters* and joint agency regulations, policies, and guidance.

The entire survey area was assessed to determine the presence or absence of aquatic features. The routine method was applied by selecting data collection point locations in the field. These sampling points were placed at locations where landform, vegetative, or hydrologic characteristics indicated the potential for the occurrence of wetlands. A minimum of one set of paired data points (one within a wetland and one just outside wetland boundaries) was established to help delineate each wetland or wetland complex. Additional data points were located as needed to help determine wetland boundaries. Detailed information on vegetation, soils, and hydrologic characteristics was collected for each data point and used to determine whether an area qualifies as a wetland and to help identify the wetland boundaries.

Delineation data forms that document the basis for determining whether an area qualifies as a wetland were completed for data collection point locations and are included as Appendix B, Wetland Delineation Forms. In 2016, all previously delineated wetlands were reviewed in the field. Where wetland boundaries appeared unchanged from delineation boundaries identified in 2012 and 2013, the delineation team relied on data forms completed in 2012 and 2013. Where wetland boundaries appeared to have changed or were in question, the delineation team established new data collection point locations as determined necessary in accordance with the routine method.

Based on information gathered from sample points and observable changes in elevation and plant communities, wetland boundaries within in the survey area were mapped in the field using a handheld sub-meter-accurate global positioning system (GPS) unit. Other aquatic resources were mapped to the OHWM by GPS in the field. In some cases, polyline GPS data was collected for aquatic resource boundaries that was converted to polygon data in GIS (ArcMap). GPS data were exported into ArcMap and edited based on a review of aerial photographs followed by additional field visits to produce and refine delineation maps for the survey area. These data were also used to calculate the lengths of waterways and acreages of wetland features in the survey area.

*Hydrophytic vegetation* is present when a plant community is dominated by species that can tolerate prolonged conditions of soil saturation or inundation. *Hydric soils* are soils that are saturated, flooded, or ponded sufficiently to develop anaerobic conditions (lacking oxygen) in the upper portion (toward surface) of soils. *Wetland hydrology* generally includes areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support hydrophytic vegetation and develop hydric soils.

### 4.3.1 Wetlands

Determination of the occurrence of wetlands is based on the presence or absence of hydrophytic (wetland) vegetation, hydric (wetland) soils, and wetland hydrology. The presence of all three of the criteria is necessary for an area to be designated as a wetland unless a parameter is significantly disturbed or naturally problematic. Wetland boundaries are considered to be a line across which the vegetation, soils, and hydrologic characteristics began/cease to meet wetland criteria.

### Vegetation

Hydrophytic vegetation includes plants that are adapted to grow in water, or in substrate that is at least periodically deficient in oxygen as a result of excessive water contact. Hydrophytic vegetation indicators include prevalence of hydrophytic vegetation (majority of dominant plant species that are facultative or obligate wetland plants as listed in the *National Wetland Plant List* (NWPL) and morphological or physiological adaptations to saturated soil conditions. Table 4-1 describes the NWPL indicator status system assigned to plant species for the purpose of delineating wetlands (Lichvar and others 2012).

**Table 4-1. NWPL Wetland Indicator Status System**

Arid West Indicator Status	Indicator Symbol	Definition
Obligate	OBL	Plants that almost always occur in wetlands.
Facultative wetland	FACW	Plants that usually occur in wetlands, but may occur in non-wetlands.
Facultative	FAC	Plants that occur in wetlands and non-wetlands.
Facultative upland	FACU	Plants that usually occur in non-wetlands but may occur in wetlands.
Upland plants	UPL	Plants that almost never occur in wetlands.
Not listed	NL	Plants that are not listed on the NWPL Plant Indicator Status List and are therefore assumed to be upland plants unless otherwise noted.

Source: Lichvar and others 2012

Vegetation was documented within a sample plot surrounding each sampling point location. Each polygon area was visually inspected and plant species were identified. If an area was substantially different in soils, vegetation, hydrology, or condition, the polygon was divided into two polygons in order to characterize each area separately. Vegetation was considered hydrophytic when over 50% of the dominant species had an indicator status of facultative (FAC), facultative wetland (FACW), or obligate (OBL) or when the prevalence index was less than 3.0 in cases where the dominance was less than or equal to 50%. To identify the

appropriate indicator status of each plant species recorded, the delineation team referenced the version of the NWPL *Arid West Regional Wetland Plant List* that was available for delineation fieldwork and analysis (Lichvar 2012; Lichvar 2013; Lichvar and others 2016). In 2016, the delineation team also considered whether changes between the 2016 NWPL for the Arid West Region and prior versions warranted additional field investigations for previously delineated wetlands. A list of observed plant species, including their NWPL 2016 indicator status, is provided in Appendix D.

## Soils

Hydric soils are soils that are saturated, flooded, or ponded for long enough during the growing season to develop anaerobic conditions in the upper part of the soil profile. Anaerobic conditions favor the growth and regeneration of hydrophytic vegetation. Hydric soil indicators can include organic soils (histosols), mineral soils saturated and rich in organics (histic epipedons), sulfidic odor, low dissolved oxygen concentration (aquic moisture regime) and reducing conditions, gleyed and/or low chroma soils, soils listed on national, state, or local hydric soils lists, and iron and manganese concentrations close to the soil surface. In accordance with USACE methodology prescribed in the Arid West regional supplement, soil profiles were investigated at sampling points in the survey area and were examined for indicators of hydric conditions. A standard Munsell® soil color chart was used to determine colors of the soil matrix and redoximorphic features (Munsell Color 2009).

## Hydrology

The term “wetland hydrology” encompasses all hydrologic characteristics of areas that are periodically inundated or have soils saturated to the surface at some time during the growing season. Areas with evident characteristics of wetland hydrology are those where the presence of water has an overriding influence on characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively. Wetland hydrology indicators include observing obvious characteristics such as surface water, soil saturation, and water table depth. Other indicators include soil cracking, salt crust, drainage patterns, water-stained leaves, and presence of oxidized rhizospheres. Hydrology was evaluated at each wetland determination sampling point location within the survey area.

### 4.3.2 Other Aquatic Resources

This delineation also evaluated the presence of aquatic resources other than wetlands potentially subject to USACE jurisdiction. Non-wetland aquatic features were delineated based on the presence of bed and bank, evidence of an OHWM (USACE 2005; Lichvar and McColley 2008), and evidence of flow of water (USACE 2008a). Non-wetland features were delineated along the OHWM. If a feature did not exhibit bed and bank and an OHWM, and did not contain a predominance of hydrophytic vegetation, it was not further evaluated as a potential wetland, and it was not considered to be an aquatic resource. Types of other aquatic resources evaluated include streams, other linear features such as drainage channels, open water ponds, and mineral flat basins classified as “playa”.

## Types of Streams

### Perennial

Perennial water features are those that usually flow all year during typical years, or with lower to no flows during short periods during drier years. Precipitation runoff is not a primary water source but can supplement stream flow.

### Intermittent

Intermittent stream features are channels that flow most of or during parts of the year when groundwater (within the channel or up-gradient) is in sufficient supply to allow surface water flows. During dry, lower groundwater periods, these channels are likely not to be flowing or may even have their channels dry. Rainfall can also supplement stream flow but is not the primary water source.

### Ephemeral

Ephemeral features are those that are supported solely by rainfall events, and are always above the water table. These features are only likely to flow during and shortly after precipitation events or periods of rainfall. Ephemeral channels can be distinguished by swales and erosion features by receiving flows sufficiently often (typically at least every year or so) to maintain a clear and definable OHWM.

#### What are ephemeral, intermittent, and perennial streams?

An *ephemeral stream* (or wash) generally flows only during or immediately after a precipitation event. An *intermittent stream* usually flows seasonally. A *perennial stream* typically flows year-round.

### 4.3.3 Observations Pertaining to Jurisdictional Status of Delineated Aquatic Resources

USACE considers an area to be a wetland if it is characterized by the three parameters of hydrophytic vegetation, hydric soils, and wetland hydrology. Other aquatic resources are identified based on evidence of an OHWM. However, as described in Section 2.1, for these resources to be subject to regulation under the CWA, they also must meet jurisdictional criteria. Under current guidance, the USACE asserts jurisdiction over wetlands that are adjacent to a traditional navigable waterbody (TNW), relatively permanent non-navigable tributaries of TNW, and wetlands that directly abut relatively permanent non-navigable tributaries of TNW (USACE 2008a). A fact-specific analysis is employed to determine whether wetlands that are adjacent but not abutting to non-navigable tributaries have a significant nexus with a TNW (USACE 2008a). Wetlands adjacent to non-navigable tributaries that lack a significant nexus and any wetlands determined to be isolated would not be subject to CWA jurisdiction if they do not have an identifiable connection to interstate or foreign commerce and they do not include interstate waters.

The survey area is located in the general vicinity of the eastern shorelands of the Great Salt Lake and large portions of the survey are either within or adjacent to an expansive complex of wetlands and other aquatic resources that intersect the upper limits of the Great Salt Lake. Because the Great Salt Lake is a TNW, wetlands adjacent to the lake are jurisdictional. In

1 portions of the survey area that are not adjacent to the Great Salt Lake, the delineation team  
2 identified potential connections and evaluated whether wetland were abutting or otherwise  
3 adjacent to non-navigable tributaries. The delineation team also evaluated whether linear  
4 features, such as ditches, were excavated in wetlands or uplands and carried a relatively  
5 permanent flow of water.

## 5.0 Environmental Setting

The survey area is located within urban, agricultural, and open space areas. The survey area crosses numerous existing arterial roads and transportation corridors including I-15 and a Union Pacific Railroad line. The majority of the survey area is characterized as agricultural land that is typically located near or adjacent to both developed (residential and commercial) areas and open space areas including other agricultural lands and areas protected for wildlife habitat. Wetlands and other habitats in the survey area pertain to the Great Salt Lake ecosystem.

Topography in the survey area includes relatively subtle depressions, gently lake sloped terraces and plains, small rolling knolls, and the toe of a relatively large bluff. The survey area ranges in elevation from just below 4,212 to around 4,260 feet above mean sea level (AMSL) and generally decreases from east to west.

## 5.1 Existing Field Conditions

The delineation field reconnaissance was conducted between May 2 and September 26, 2012, between April 24 and June 26, 2013, between July 18 and September 28, 2016, and between May 12 and June 1, 2017. During this time, temperatures were mainly in the middle to high 60s, 70s, 80s and 90s (degrees Fahrenheit), and, in general, temperatures were average for the time of year (USCD 2017). Table 5-1 provides overall and monthly temperature, precipitation, and snowfall averages for the Salt Lake City, Utah area.

**Table 5-1. Climate Data Summary for Salt Lake City: 2011 - 2016**

Source: U.S. Climate Data for Salt Lake City, Utah (USCD 2017).

Annual precipitation was above average in 2011 and below average from 2012 through 2016. The winter of 2011-2012 had lower than average snowfall and the spring of 2012 was drier than average. The winter of 2012-2013 had higher than average snowfall whereas the spring of 2013 was drier than average. The winters of 2013-2014 and 2014-2015 had lower than average snowfall. The winter of 2015-2016 average to low snowfall and the spring of 2016 was drier than average.

During field surveys, tree and shrub species were leafed out and many wildflowers were blooming, then going to seed later in the season. At field surveys conducted during middle to late summer and early fall (2012 and 2016), many wetland areas appeared dry and in some areas vegetation in both upland areas and seasonal wetlands was dried out. Anecdotally, conditions at seasonal wetland areas generally appeared drier during summer 2016 in comparison to the summer of 2012. However, based on observed annual vegetation growth and apart from some areas affected by other factors (such as residential development), these wetlands still appeared to be supported by sufficient seasonal hydrology to sustain hydrophytic communities. Despite dry field conditions at times, most of the herbaceous plant species, including grasses and forbs, were identifiable based on plant growth and flowers.

#### What is a forb?

A *forb* is an herbaceous flowering plant that is not a graminoid (grasses, sedges, and rushes).

Land uses are changing extensively in the survey area. Much of the survey area is farmland, land used for grazing, or open, fallow fields. Many residential developments are under construction, including numerous sites in the survey area near the Great Salt Lake shoreland areas.

### 5.1.1 General Hydrology

Many of the wetlands and other WOUS in the survey area are hydrologically connected to the Great Salt Lake. The Great Salt Lake, groundwater discharge areas, streams, canals, and flood irrigation influence the groundwater levels in the survey area. The survey area and adjacent land generally drains south and/or west toward the lake.

Some of the investigated areas are influenced by irrigation. The wetland delineation team did not make any jurisdictional distinction between areas that are likely supported primarily by irrigation water and areas that are likely supported primarily by other hydrology sources. Representatives with USACE have stated that, in order for it to make this determination, irrigation water would likely have to be turned off and the site investigated under non-irrigated conditions. UDOT does not have the authority to require landowners to stop irrigating their properties so the wetland delineation team did not distinguish between irrigation-supported hydrology and other types of hydrology when evaluating potential

wetlands. In instances where irrigation visibly influenced a site, the delineation team noted irrigation characteristics in the field surveys documentation. In some cases where sampled areas did not satisfy wetland criteria, the delineation team ascertained that irrigation water sustained some hydrophytic plants but did not provide sufficient periods of saturation or inundation to form hydric soils.

Based on field observations and the history of agricultural development in the survey area, apparently many of the investigated fields in the survey area have been drained. The current condition of most of these drainage systems is unknown.

In some cases, there was no apparent hydrology when delineation fieldwork was conducted during July, August, and September of both 2012 and 2016, but there was a dominance of hydrophytic plants, and the soils were mapped as hydric and/or displayed hydric soil indicators. Hydrology indicators were reviewed but, at some locations, indicators were insufficient to positively identify wetland hydrology at a sampling area. In accordance with delineation procedures, these locations were identified as naturally problematic for hydrology and the area was delineated as a wetland. The team assumed that seasonal hydrology, whether natural or irrigation-induced, is present during portions of the growing season.

### 5.1.2 General Soil Conditions

A variety of soil types exist in the survey area, some of which are listed as hydric in the Soil Survey of Utah. Determinations in the soil survey indicate only the potential for a particular soil type, based on its degree of water infiltration, to be considered as a wetland hydric soil if it is wetted for long enough during the growing season to sufficiently experience anaerobic conditions in the rooting zone of herbaceous plants (up to about 24 inches deep). Regardless of a soil's rating as hydric or not hydric in the soil survey, any particular soil typically must satisfy at least one of the appropriate indicators of hydric soils listed by NRCS (2016) to meet the hydric soil parameter and be considered a wetland.

A challenging soil condition experienced in parts of the survey area was alkaline soils. Soil alkalinity can sometimes affect certain redoximorphic features, making them either not visible or less apparent in the soil profile, potentially resulting in those soils not meeting the proper hydric soil indicators given the actual hydric conditions experienced in those soils. These situations are discussed as problematic hydric soils in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008b). In areas where wetland hydrology and halophytic (salt-loving), hydrophytic vegetation were indicated but soils failed to show hydric indicators, the area was delineated as a wetland, and the team assumed that hydric soils were present.

In other areas that were not comprised of halophytic vegetation communities (but sometimes included species with mixed salt tolerance), hydric indicators were repeatedly identified in wetlands areas with strongly hydrophytic vegetation but were not present in upslope areas that are apparently confounded by irrigation. Based on coordination with the USACE in 2012, soils in irrigated areas with non-halophytic communities that did not exhibit hydric indicators were not delineated as wetlands. At a few sites, hydric indicators were not

identified at sampled areas dominated by tall emergent marsh vegetation. Based on coordination with the USACE, these areas were delineated as emergent marsh wetlands.

## Soil Types

Soil map unit boundaries within the survey area are provided in Appendix F, NRCS Soil Map Series. Soil types included within the project site are described in a single report: *Custom Soil Resource Report for Davis-Weber Area, Utah. West Davis Corridor* (NRCS 2017). This report is included with this memorandum as Appendix G and contains detailed descriptions of soils within the WDC study area.

The following soil types for the WDC Project are described in Appendix G:

Ackmen loam, 3 to 6 percent slopes	Lakeshore fine sandy loam, 0 to 1 percent slopes
Airport silt loam, 0 to 2 percent slopes	Layton loamy fine sand, 0 to 3 percent slopes
Airport silty clay loam, 0 to 1 percent slopes	Logan silty clay loam, 0 to 3 percent slopes
Arave-Saltair complex, 0 to 1 percent slopes	Logan silty clay loam, shallow water table, 0 to 3 percent slopes
Chance loam, 0 to 3 percent slopes	Parleys loam, 0 to 4 percent slopes
Chance-Ironton complex, 0 to 3 percent slopes	Parleys loam, 1 to 3 percent slopes
Cobbly alluvial land	Parleys loam, 3 to 8 percent slopes
Cudahy silt loam, 0 to 1 percent slopes	Parleys loam, 6 to 10 percent slopes
Draper loam, 0 to 1 percent slopes	Pintailake-Eimarsh-Playas complex, 0 to 1 percent slopes
Draper loam, 1 to 3 percent slopes	Payson-Warm Springs complex, 0 to 3 percent slopes
Draper loam, drained, 0 to 1 percent slopes	Roshe Springs silt loam, 0 to 3 percent slopes
Draper loam, drained, 1 to 3 percent slopes	Saltair silty clay loam, 0 to 3 percent slopes
Draper gravelly loam, gravelly subsoil variant, 3 to 6 percent slopes	Sunset loam, drained, 0 to 1 percent slopes
Eimarsh-Playas-Pintailake complex, 0 to 1 percent slopes	Sunset loam, drained, 1 to 3 percent slopes
Ford loam, 0 to 1 percent slopes	Syracuse loamy fine sand, 0 to 2 percent slopes
Ford loam, shallow water table, 0 to 1 percent slopes	Saltair-Playas-Lasil complex, 0 to 1 percent slopes
Harrisville silt loam, 0 to 1 percent slopes	Syracuse loamy fine sand, moderately saline, sodic, 0 to 2 percent slopes
Harrisville-Leland complex, 0 to 1 percent slopes	Timpanogos loam, 0 to 1 percent slopes
Ironton silt loam, 0 to 1 percent slopes	Timpanogos loam, 1 to 3 percent slopes
Ironton silt loam, 1 to 3 percent slopes	Timpanogos loam, 3 to 6 percent slopes

Iron-ton silt loam, saline, sodic, 0 to 1 percent slopes	Warm Springs fine sandy loam, 0 to 1 percent slopes
Iron-ton-Draper complex, 0 to 3 percent slopes	Warm Springs fine sandy loam, 1 to 3 percent slopes
Kidman fine sandy loam, 0 to 1 percent slopes	Warm Springs fine sandy loam, saline, sodic, 0 to 1 percent slopes
Kidman fine sandy loam, 1 to 3 percent slopes	Warm Springs fine sandy loam, saline, sodic, 0 to 1 percent slopes, channeled
Kidman fine sandy loam, 3 to 6 percent slopes	Warm Springs fine sandy loam, shallow water table, 0 to 1 percent slopes
Kidman fine sandy loam, 10 to 20 percent slopes, eroded	Woods Cross silty clay loam, 0 to 3 percent slopes
Kilburn gravelly sandy loam, 3 to 6 percent slopes	Woods Cross silty clay loam, drained, 0 to 3 percent slopes

The soil map autogenerated in the Appendix G soil resource report is difficult to interpret, but Appendix F, NRCS Soil Map Series, provides soil map unit boundaries within the survey area.

Twelve hydric soils for Utah (NRCS 2016a) are included in the soil resource report:

- Arave-Saltair complex
- Harrisville-Leland complex
- Iron-ton-Draper complex
- Pintailake-Eimarsh-Playas complex
- Airport family
- Draper family
- Cudahy family
- Ford Loam family
- Lakeshore family
- Logan family
- Warm Springs family
- Syracuse family

These 12 hydric soils all belong to Hydrologic Soil Group's C or D, with each soil type generally found in a lake plains or lake terrace setting. Two main hydric soil indicators, depleted matrix and depleted below dark surface occur in nearly all of these hydric soils. The presence of some relatively unique indicator include sandy redox, hydrogen sulfide, and redox dark surface. The salinity profile for the majority of these soils is moderately saline to strong saline. Overall the slope is typically 0 to 3 percent with depth to restrictive features at more than 80 inches. Typical profile composition consists of repetitions of silt loam layers and silty clay loam layers.

### 5.1.3 General Plant Community Types

In general, the survey area contains wetland, riparian, and upland plant communities. Appendix D, List of Plant Species Observed, lists the plant species that were observed in the survey area including the scientific name, common name, family name, and Arid West Region Wetland Indicator status (Lichvar 2016).

#### Wetland Communities

Based on the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979), two wetland habitat types are present in the survey area: palustrine emergent marsh and palustrine unconsolidated bottom. Areas identified as “playa” (described below) are technically a distinct aquatic resource from wetlands, but are included within wetland sections of this document. No forested/scrub-shrub wetlands communities were delineated because corresponding species were not found rooted within wetland communities greater than five percent by strata. The delineation team categorized wetland communities in the survey area by three general vegetation cover classes: emergent marsh, playa, and wet meadow.

**Emergent Marsh.** Emergent marshes in the survey area include wetlands that are inundated seasonally, semi-permanently, and permanently to yield plant communities that can tolerate prolonged periods of standing water. Common species in these communities include common reed (*Phragmites australis*), hardstem bulrush (*Schoenoplectus acutus*), broadleaf cattail (*Typha latifolia*), sedges (*Carex* spp.), reed canarygrass (*Phalaris arundinacea*), and three-square (*Schoenoplectus pungens*).

**Playa.** The survey area include some relatively small depressional areas that are seasonally inundated and are highly saline/alkaline. These features delineated as playas exhibit an OHWM and their overall absolute vegetation cover is less than 5%. Playas in the survey area generally include a narrow fringe higher cover vegetation along the playa edges and little to no vegetation further inside the playa. Common species along playa fringes include saltgrass (*Distichlis spicata*), saltmarsh bird’s-beak (*Cordylanthus maritimus*), Nuttall’s alkaligrass (*Puccinellia nuttalliana*), pursh seepweed (*Suaeda calceoliformis*), red swampfire (*Salicornia rubra*), iodine bush (*Allenrolfea occidentalis*), and little barley (*Hordeum pusillum*). Red swampfire, pursh seepweed, and iodine bush occur across interior portions of some playas.

**Wet Meadow.** Wet meadows include wetlands that are inundated temporarily or are only seasonally or intermittently saturated. These hydrologic regimes support communities that are hydrophytic but cannot withstand prolonged inundation. Most wet meadows in the survey area experience seasonal or intermittent hydrology such that vegetation tends to dry out during late summer months.

Due to variability in local hydrology, salinity/alkalinity, and land uses such as grazing, wet meadow communities in the survey area are relatively diverse. Some depressional wetland meadows are highly saline with relatively low vegetation cover dominated by salt-tolerant species such as saltgrass, saltmarsh bird’s-beak, Nuttall’s alkaligrass, and pursh seepweed. Other wet meadows that include freshwater inputs are comprised of more diverse and dense

vegetation including sedges, rushes (*Juncus* spp.), common spike-rush (*Eleocharis palustris*), curly dock (*Rumex crispus*), foxtail barley (*Hordeum jubatum*), strawberry clover (*Trifolium fragiferum*), and three-square. Several large wet meadows in the survey area include transitional areas along salinity gradients that include a mix of vegetation. Some wet meadows have relatively high cover in invasive species and weeds including broadleaved pepperweed (*Lepidium latifolium*), reed canarygrass, two-seed saltbush (*Atriplex micrantha*), and fuller's teasel (*Dipsacus fullonum*). A few wet meadows also contain some shrubs and trees; however, they are generally sparse and were observed at under 5% in aerial cover. Most of these woody species, such as Russian olive (*Elaeagnus angustifolia*) and salt cedar (*Tamarix ramosissima*), are not native.

## Riparian Communities

Riparian communities in the survey area are primarily located adjacent to streams and some canals and ditches. None of the riparian communities in the survey area meet all three of the CWA criteria for wetlands (other than delineated wetlands in riparian areas that were dominated by herbaceous vegetation) because they are located along the narrow, upland banks of these creeks and other drainages. Common plant species in riparian communities include Fremont cottonwood (*Populus fremontii*), Russian olive, salt cedar, willows (*Salix* spp.), tall wheatgrass (*Thinopyrum ponticum*), and cheatgrass (*Bromus tectorum*).

## Upland Communities

Much of the survey area that is not developed is currently being used as pastureland. Common plant species in these areas include meadow fescue (*Festuca pratensis*), alfalfa (*Medicago sativa*), tall wheatgrass, cheatgrass, Japanese brome (*Bromus japonicus*), clasping pepperweed (*Lepidium perfoliatum*), prickly lettuce (*Lactuca serriola*), common dandelion (*Taraxacum officinale*), white clover (*Trifolium repens*), red clover (*Trifolium pratense*), two-seed saltbush, Canada thistle (*Cirsium arvense*), field bindweed (*Convolvulus arvensis*), whitetop (*Cardaria dabra*), yellow sweet clover (*Melilotus officinalis*), common teasel (*Dipsacus fullonum*), and curly gumweed (*Grindelia squarrosa*).

A few areas were identified as upland salt scrub and are dominated by greasewood (*Sarcobatus vermiculatus*) and iodine bush (*Sarcobatus vermiculatus*). Upland areas in the survey area also include a variety of croplands.

## 5.2 National Wetlands Inventory Wetland Mapping

The NWI maps that cover the survey area are included in Appendix E, NWI Map Series. NWI maps provide data on wetlands and deepwater habitats such as lakes and streams, categorized by the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin Classification System; Cowardin et al. 1979). NWI data are primarily based on high altitude imagery interpretation and do not represent regulatory boundaries.

## 6.0 Results

As described in Section 3.3, the entire 4,416-acre survey area was evaluated for the presence of wetlands and other aquatic resources. The sections that follow describe the results of the delineation.

The maps in Appendix A, Aquatic Resource Delineation Map Series, depict the extent of aquatic resources within the survey area and provide the locations of delineation sampling points. Field data recorded on datasheets are provided in Appendix B, Wetland Delineation Forms. Representative photographs were also taken during site surveys to document existing site conditions; these are provided in Appendix C, Onsite Representative Photographs. A list of observed plant species was compiled and is provided in Appendix D, List of Plant Species Observed.

Within the survey area, a total of 567 sampling points were recorded on field data forms. Appendix H, Field Data Points Summary, lists the field data sampling points and provides the corresponding map sheet number for locating each data point in Appendix A and Appendix B. The datasheets, representative photographs, and data point summary are each roughly ordered from south to north by sampling point ID as they appear on the maps in Appendix A.

### 6.1 Wetlands

One hundred ninety-six wetlands totaling 732.65 acres within the survey area were delineated and mapped as emergent marsh, playa, and wet meadow wetlands. Map sheets 1 through 37 show the boundaries of areas delineated wetlands within the survey area and associated data-point locations (see Appendix A, Aquatic Resource Delineation Map Series). It should be noted that many of these wetlands continue well beyond the survey area boundaries and that mapped wetland areas shown outside the survey area are included only to help provide context. Data forms used to help delineate the wetland boundaries are provided in Appendix B, Site Wetland Delineation Forms.

Wetland characteristics are summarized below by three regions that make up the survey area: the South Region (Map Sheets 1–14 in Appendix A), the Central Region (Map Sheets 15–27), and the North Region (Map Sheets 27–37). Table 6-1, beginning on page 25, presents general information about each wetland including size, classification, characteristics descriptions, and connections to other aquatic resources. The West Davis Corridor Wetlands Functional Assessment Report, provides the results of the functional assessment conducted for the delineated wetlands.

#### South Region

Eighty-nine wetlands totaling 274.09 acres were delineated within the South Region (see Map Sheets 1–14). Much of this region of the survey area is located near developing areas within agricultural areas adjacent to or within the wetlands complex associated with the Great Salt

Lake. Portions of the survey area in this region are located within the USACE floodplain for the Great Salt Lake (4,217 AMSL) and a few areas are located below 4,212 AMSL. The south end of the survey area intersects with I-15 and Legacy Parkway in a primarily urbanized environment.

Wetlands within or immediately adjacent the Great Salt Lake complex wetlands are known to provide important habitat for wildlife, including numerous species of migratory birds. These wetlands also provide water quality functions and flood attenuation. Common reed is a problematic invasive species in several of these wetlands. Wetlands are hydrologically supported by shallow groundwater and surface drainage. Emergent marshes are mainly semi-permanently to permanently flooded or saturated, while wet meadows are seasonally or intermittently flooded/saturated. The upslope extent of these wetlands appears to be influenced in some instances by irrigation tailwater and stormwater drainage. The wetlands in urbanized areas are generally disturbed, highly influenced by stormwater drainage, and often impounded by linear features such as roads and rail lines.

### Central Region

Sixty-eight wetlands totaling 308.84 acres were delineated within the Central Region (see Map Sheets 15–27). In this region, the survey area is generally within agricultural areas and adjacent to or within the wetlands complex associated with the Great Salt Lake. Portions of the survey area in this region are located within the lake’s USACE floodplain. Agricultural areas in this region include large croplands and pastures.

The vast majority of wetlands delineated in this region are part of a relatively continuous complex of wetlands that extend to the Great Salt Lake and so provide important habitat for wildlife and also provide water quality functions and flood attenuation. A few of these wetlands are somewhat degraded by livestock grazing, but dominance by common reed is the biggest detracting factor to habitat quality for several wetlands. Wetlands are hydrologically supported by shallow groundwater and surface drainage. Emergent marshes are mainly semi-permanently to permanently flooded or saturated, while wet meadows are seasonally or intermittently flooded/saturated. The upslope extent of these wetlands appears to be influenced in some instances by irrigation tailwater and stormwater drainage.

Other wetlands are located upslope of the Great Salt Lake wetlands complex. These wetlands are in pasturelands, fallow fields, and drainage areas. These wetlands appear to be influenced by irrigation and stormwater drainage. They provide variable wildlife habitat and also limited hydrology and water quality functions along drainages.

### North Region

Thirty-nine wetlands totaling 149.72 acres were delineated within the North Region (see Map Sheets 28–37). Wetlands in this region are mainly located near Bluff Road in Syracuse and Layton and are inland from the complex of wetlands that are associated with the Great Salt Lake. Areas just below the toe of the geographic bluff formation along Bluff Road appears to include natural discharge areas where several wetlands appear to be hydrologically supported by shallow groundwater.

1 Most of the wetlands in the North Region appear to be at least somewhat affected by human  
2 activities. Some wetlands are present in areas that have been excavated. Other wetlands  
3 appear to be influenced by irrigation and current or recent livestock grazing. Common reed is  
4 a dominant invasive species within the wetlands that are present in areas that have been  
5 excavated. The condition of wetlands in pasturelands is fairly variable and mainly appears to  
6 be dependent on the amount of grazing pressure.

7 Wetlands in this region provide relatively marginal habitat for wildlife, including migratory  
8 birds that occur in semi-urban areas. Some wetlands also appear to perform water quality  
9 functions that are primarily associated with irrigation and stormwater drainage that eventually  
10 flows into the Great Salt Lake.

24-W-47	WM	PEM	0.91	40.96616743	-111.9195945	4	vegetated non-wetland swale, then to a drainage ditch that empties into wetlands/waters at Farmington Bay Waterfowl Management Area.
25-W-48	WM	PEM	0.06	40.96538554	-111.9187191	4	Wet meadow bisected by Glover's Lane from Farmington Bay wetlands to the south that drain into Farmington Creek. Connected to wetland via ditch culvert.
25-W-49	WM	PEM	0.70	40.96552544	-111.9157049	4	Wet meadow with relatively diverse vegetation on the north side of Glover's Lane. May be considered adjacent to wetlands to the south across the road.
25-W-50	WM	PEM	0.26	40.96515243	-111.9158949	4	Wet meadow dominated by Artic rush on the south side of Glover's Lane near the entrance to Farmington Bay Waterfowl Management Area. May be considered adjacent to wetlands across entrance road the join wetland complex that drains into Farmington Creek/Farmington Bay.
25-W-56B	P	PUB	1.32	40.96198185	-111.9063525	4	Part of mosaic of wetlands in pasture near Farmington Bay Waterfowl Management Area. Species along playa fringe include saltmarsh bird's beak, pickleweed, and Nuttall's alkaligrass. Abuts drainage 14-FD-60 that drains into wetlands then into Farmington Bay.
25-W-57	EM	PEM	0.10	40.96389465	-111.9081635	4	Part of mosaic of wetlands in pasture near Farmington Bay Waterfowl Management Area with portions somewhat disturbed by grazing. Plant species include common reed, poison hemlock, teasel, reed canarygrass, tall pepperweed, and threesquare. Seems to receive substantial hydrology from WOUS drainage 14-FD-60 that drains into Farmington Bay and an artesian well located near the northeast corner of wetland 25-W-17.
25-W-71	EM	PEM	3.71	40.96210815	-111.9084433	4	
25-W-59	WM	PEM	1.02	40.9666094	-111.9060741	4	Wetland in field adjacent to residential area is dominated by arctic rush and clustered field sedge. Abuts ditch/drainage 25-FD-60 that drains into Farmington Bay.
25-W-60	WM	PEM	1.74	40.9628305	-111.9096713	4	Part of mosaic of wetlands in pasture near Farmington Bay Waterfowl Management Area with portions somewhat disturbed by grazing. Wet meadow species include saltgrass, two-seed saltbush, curly dock, and Nuttall's alkaligrass. Seems to receive substantial hydrology from drainage 14-FD-60 that drains into Farmington Bay and an artesian well located near the northeast corner of wetland 25-W-17.

Wetland ID <sup>1</sup>	Cover Class <sup>2</sup>	Cowardin Code <sup>3</sup>	Size (acres) <sup>4</sup>	Latitude <sup>5</sup>	Longitude <sup>5</sup>	Map Sheet <sup>6</sup>	Description
MP09272016-1	EM	PEM	0.87	40.97101214	-111.935905	6	Wetland with emergent vegetation that appears to be supported by a well. Hydrology dissipates into upland grasslands.
20-W-02	EM	PEM	12.46	40.99277417	-111.9435292	7, 8, 9	Relatively large emergent marsh includes some native species (bulrush and threesquare) but is mainly dominated by common reed. Baer Creek and Haight Creek each flow into this wetland. Adjacent to the Great Salt Lake wetlands complex. Separated by a dike road from wetlands to the west, but culverts provide hydrologic connections.
22-W-10	EM	PEM	8.50	40.98295936	-111.9393107	7	Emergent marsh wetland that is part of the Great Salt Lake wetland complex. Plant species include common reed, bulrush, threesquare, cattail, and Torrey's rush.
22-W-27	WM	PEM	5.32	40.99071458	-111.9403021	7, 8	Large wet meadow that abut emergent marshes (20-W-02 and 22-W-27b) that are connected to the Great Salt Lake wetlands complex. Exhibits relatively diverse vegetation with large patches dominated by saltgrass, Nuttall's alkaligrass, spikerush, and foxtail barley. Southern portion receives stormwater drainage.
22-W-43	EM	PEM	7.06	40.98620419	-111.937018	7	Wetlands dominated by common reed, cattail, and bulrush that is considered part of the Great Salt Lake wetland complex. Separated by dike road from wetlands to the west but hydrologically connected through drainage culverts. TNC indicated this area was previously open water until drainage was modified several years ago. Includes drainage wetland complex with abutting wet meadows.
22-W-27b	EM	PEM	5.78	40.98929599	-111.9394313	7	
22-W-55d	EM	PEM	0.35	40.9869149	-111.934792	7

22-W-44	WM	PEM	20.58	40.98492666	-111.9391907	7	Saline meadow wetland that appears heavily grazed is dominated by Nuttall's alkaligrass and saltgrass. Also contains tall pepperweed. Pertains to the Great Salt Lake wetland complex as it abuts emergent marshes to the west.
22-W-55b	WM	PEM	0.80	40.98683391	-111.933293	7	Part of wetland drainage complex that abuts emergent marsh 22-W-43 and is connected to the Great Salt Lake wetlands complex. Relatively diverse vegetation including saltgrass, clustered field sedge, threesquare, foxtail barley, tall pepperweed, and strawberry clover.
22-W-42	WM	PEM	2.36	40.98582949	-111.936643	7	
22-W-55c	WM	PEM	4.40	40.98679898	-111.935003	7	

**Table 6-1. Delineated Wetlands**

Wetland ID <sup>1</sup>	Cover Class <sup>2</sup>	Cowardin Code <sup>3</sup>	Size (acres) <sup>4</sup>	Latitude <sup>5</sup>	Longitude <sup>5</sup>	Map Sheet <sup>6</sup>	Description
20-W-05	WM	PEM	0.08	40.99631528	-111.9399144	8	Wet meadow wetlands in low corner of pasture fields. Vegetation includes Torrey's rush, foxtail barley, strawberry clover, spikerush, and meadow fescue.
20-W-70	WM	PEM	0.22	40.99625383	-111.9392661	8	
20-W-03	EM	PEM	0.27	40.99639775	-111.9470935	9	Wetland is a narrow swale-like feature that appears to be a remnant of excavation activity to create a berm to the east for an agricultural field. No obvious surface connection to nearby wetlands to the west, but area is nearly flat in between, and water from wetland 20-W-02 likely back-floods into this wetland at times. Adjacent to 20-W-02 which connects hydrologically to the Great Salt Lake wetlands complex.
20-W-24	EM	PEM	0.26	40.99872924	-111.9511946	9	Wetland pertains to the Great Salt Lake wetlands complex. Dominant species include bulrush and threesquare. Likely receives some inputs from the nearby sewer treatment plant.
20-W-25	WM	PEM	0.61	40.99559062	-111.9457982	9	Constructed basin delineated as open-water near berm (20-OW-04); remainder of basin delineated as wetland (20-W-25). Basin appears to be constructed in a wetland area. Located near mink farm; likely constructed for water quality functions. No outlet through berm, but adjacent to wetlands to the west that are connected to the Great Salt Lake.
18-W-67	EM	PEM	1.29	41.01087399	-111.9641506	10, 11	Wide drainage channel that is completely filled in with wetland vegetation (dominated by obligate species). Drains to Great Salt Lake wetland complex.
MPAC09262016-3	WM	PEM	0.30	41.00697423	-111.9608376	10	Saline wet meadow fringe that abuts emergent marsh and connected to Great Salt Lake wetlands complex. Situated below agricultural fields. Dominant vegetation includes saltgrass and seepweed.
MPAC09262016-4	EM	PEM	3.37	41.00807234	-111.9626558	10, 11	Extensive emergent marsh connected to Great Salt Lake wetlands complex, situated below agricultural fields along portions of the western boundary of the survey area. Dominated by cattail, common reed, and hardstem bulrush.
18-IW-01	WM	PEM	0.19	41.01099009	-111.9657167	11	Small depressional wetlands that collect irrigation overflow water from an irrigation ditch/hay field immediately upslope of the wetlands. Vegetation includes Nuttall's alkaligrass and wheatgrass. Situated near 4,212 AMSL and considered adjacent the Great Salt Lake wetlands complex.
18-IW-93	WM	PEM	0.61	41.00808166	-111.962291	10

18-W-62	EM	PEM	6.19	41.01252366	-111.9693526	11, 12	Wetland dominated by vigorous obligate vegetation (cattail, threesquare, spikerush) at the edge the interface of pasture fields and the Great Salt Lake wetland complex.
MPAC09212016-4	EM	PEM	47.68	41.01433202	-111.9753155	11, 12	Large wet meadow fringe wetlands with mixed species below upland fields and abutting emergent marshes pertaining to the Great Salt Lake wetlands complex. These wetlands also abut Holmes Creek.
MPAC09222016-2	WM	PEM	10.10	41.0150857	-111.9723771	11, 12	
MPAC09222016-4	WM	PEM	10.13	41.01302353	-111.9720487	11, 12	
MPAC09212016-5	WM	PEM	2.52	41.01702894	-111.9757998	12	
MPAC09222016-1	WM	PEM	6.24	41.01608455	-111.974695	12	
MPAC09222016-3	P	PUB	1.25	41.01187422	-111.9683945	11	Saline playa depression with little vegetation including pickleweed, seepweed, and saltgrass. Abuts emergent marsh 18-W-62 that adjoins the Great Salt Lake wetlands complex.
MPAC09262016-1	WM	PEM	1.60	41.0105608	-111.9662893	11	Saline wet meadow that abuts emergent marsh pertaining to the Great Salt Lake wetlands complex.
MPAC09262016-2	WM	PEM	0.62	41.01281806	-111.9674712	11	Relatively "freshwater" depressional wet meadow that includes a few tall emergent species along with saltgrass, foxtail barley, and Artic rush. Drains to waterway 18-FD-93 which drains to the Great Salt Lake wetlands complex.
17-IW-19	WM	PEM	1.30	41.02172726	-111.9737654	12	Depressional wetland in an irrigated field lacks a defined outlet. An adjacent irrigation ditch that appears to lack relatively permanent flows is located to the southeast of the wetland. The ditch includes an upland berm/spoils that prevents any surface water from the wetland from draining into the ditch. Located between 4,220 and 4,230 AMSL.
17-IW-20	WM	PEM	0.04	41.02069619	-111.9729231	12	Small depressional wetland in heavily grazed, irrigated field. Field drains into a small ditch and culvert that crosses road and likely connects to other drainage infrastructure, but this drainage ditch appears to lack relatively permanent flows. Located between 4,220 and 4,230 AMSL.

**Table 6-1. Delineated Wetlands**

Wetland ID <sup>1</sup>	Cover Class <sup>2</sup>	Cowardin Code <sup>3</sup>	Size (acres) <sup>4</sup>	Latitude <sup>5</sup>	Longitude <sup>5</sup>	Map Sheet <sup>6</sup>	Description
17-W-21	EM	PEM	7.02	41.01896309	-111.9744461	12	Wetland in large pasture field contains a mix of vegetation but is dominated by obligates. Somewhat affected by grazing and dumping. Wetland continues southwest beyond survey area to connect with the Great Salt Lake wetland complex.
18-W-92	WM	PEM	0.51	41.01562571	-111.9673652	12	Wetland in weedy, disturbed field that abuts ditch (18-FD-10) which flows through a series of relatively permanently flowing ditches to the Great Salt Lake. Hydrology might be reduced as a result of ditch maintenance.
MPAC09212016-1	WM	PEM	0.47	41.02326853	-111.9770385	12	Relatively narrow wet meadow in field that is flood irrigated by TNC to benefit wildlife. Adjacent to wetlands to the west that are connected to the Great Salt Lake wetlands complex.
MPAC09212016-2	WM	PEM	5.24	41.02118108	-111.9785382	12	Wet meadows in field that is flood irrigated by TNC to benefit wildlife. Vegetation includes Artic rush, clustered field sedge, saltgrass, spikerush, and seepweed. Adjacent to wetlands to the west that are connected to the Great Salt Lake wetlands complex.
MPAC09212016-3	WM	PEM	13.66	41.018698	-111.9785783	12	Wet meadows in field that is flood irrigated by TNC to benefit wildlife. Vegetation includes Artic rush, clustered field sedge, saltgrass, spikerush, and seepweed. Adjacent to wetlands to the west that are connected to the Great Salt Lake wetlands complex.
16-IW-15	WM	PEM	0.17	41.03575275	-111.9967817	14, 15	Depressional wet meadow in pasture appears to receive hydrology from an abutting irrigation ditch. Channel is part of a system of ditches that eventually drain into the Great Salt Lake wetlands complex, but this ditch does not continuously exhibit a defined bed and bank and appears to lack relatively permanent flows. Located between 4,220 and 4,230 AMSL.
16-W-14A	EM	PEM	0.42	41.03094007	-111.992669	14	Wetland near farmstead with standing water mainly dominated by cattail. Wetland is adjacent to drainage channel (09-FD-30) that drains into Great Salt Lake wetland complex.
16-W-14B	WM	PEM	0.10	41.03119327	-111.9931767	14	Wet meadow abutting emergent marsh 16-W-14A that is adjacent to drainage channel (09-FD-30).
17-W-18	EM	PEM	0.06	41.0301402	-111.9903676	14	Wetland in pasture area dominated by saltgrass and contains some obligate vegetation that appears stressed. Wetland abuts ditch/drainage channel (09-FD-30). Ditch maintenance might have reduced hydrology for this wetland.

**Table 6-1. Delineated Wetlands**

<b>Total Wetlands in Survey Area</b>			<b>732.65</b>				

<sup>1</sup> Each Wetland Feature ID provides a unique name for each wetland feature. While the naming convention for these features is often associated with corresponding delineation points and delineators, the numbering for features initially delineated in 2012 does not apply to the current delineation map series. Consequently, feature identification names (for both wetlands and other aquatic resources) and delineation point IDs in Appendix H best represent unique identifiers rather than a systematic convention.

<sup>2</sup> Cover Class refers to general vegetative cover classes: EM (emergent marsh), WM (wet meadow), and P (playa).

<sup>3</sup> Codes from *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979): PEM (palustrine emergent) and PUB (palustrine unconsolidated bottom).

<sup>4</sup> Area of wetland within the survey area boundaries. Values rounded to 2 decimal places.

<sup>5</sup> Degrees coordinates (WGS 84) provide the polygon centroid location for each delineated feature.

<sup>6</sup> See Appendix A, Aquatic Resource Delineation Map Series. Wetlands in this table are generally ordered by region (south, central, and north) and map sheet number.

## 6.2 Other Aquatic Resources

As described in Section 3.3, other (non-wetland) waters were delineated based on the presence of bed and bank, an OHWM, and evidence of carrying a relatively permanent flow of water (USACE 2008a).

A total of 60.85 acres of other waters were delineated within the survey area that consisted of seven streams, 63 other linear water features (such as ditches, canals, and drainage channels), and 14 open-water features. The maps in Appendix A, Wetlands and WOUS Delineation Maps, include labeled depictions of all of these features within the survey area. All linear water features are categorized on the maps as “Waterway,” and line transects of OHWM width measurements are provided for each stream. Table 5-2 lists water features by type and provides feature IDs, average width and length within the survey area for linear features, feature size (acres), and a brief description of each feature. Although playa features are technically a non-wetland aquatic feature, they are included with delineated wetlands in Table 5-1.

### Streams

Seven stream segments were delineated within the survey area. Headwaters for all of these streams are found in the Wasatch Mountains, several miles east of the survey area. These streams generally flow west to southwesterly across the survey area and eventually drain into the Great Salt Lake. All seven of the streams are located within the Central and South Regions of the survey area. Six of these streams appear to flow perennially, and one flows intermittently (Steed Creek). At least portions of some stream segments are in constructed channels where natural channels have been removed. Nevertheless, all of these entire segments within the survey area have been classified as streams (see Appendix A, Aquatic Resource Delineation Map Series). Refer to Table 5-2 for specific information regarding the characteristics of each of the streams in the survey area.

### Other Linear Aquatic Features

In addition to seven stream segments, 63 linear water features were delineated in the survey area. These features include irrigation ditches, canals, stormwater drainage channels, and other constructed channels that appear to carry irrigation tailwater, surface drainage, and stormwater. All of these features has a defined bed and bank, has an OHWM, and appears to carry a relatively permanent flow of water. Summary comments in Table 6-2 reflect multiple observations during the during summer months.

All of these water features appear to be connected to other water features that eventually drain to the Great Salt Lake (open waters or wetlands complex). All of these features appear

#### What is irrigation tailwater?

*Irrigation tailwater* is surface runoff from irrigation. In the survey area, several constructed channels collect tailwater from adjacent agricultural fields and eventually drain into the Great Salt Lake.

to be either entirely human-made or heavily modified in order to provide water delivery or drainage functions. Some segments of these features contain little vegetation, while others are dominated by upland vegetation. Some features contain hydrophytic vegetation along banks and sometimes within channel features. Irrigation ditches and drainage channels often begin to fill in with hydrophytic vegetation when they are not regularly maintained. Drainage features that appear completely naturalized and filled in with wetland vegetation were delineated as wetlands and are included in Section 5.1.1.

### **Open-Water Features**

Fourteen open-water features were delineated in the survey area. All of these features are ponds or basins that appear to be either entirely human-made or modified to create open-water conditions. These features typically lack much vegetation. Most of these features appear to be associated with irrigation, stock watering, or drainage functions.

**Table 6-2. Other Delineated Aquatic Resources**

Name	Resource ID	Type	Average Width (ft.) <sup>1</sup>	Size (ac) <sup>2</sup>	Length (ft.) <sup>3</sup>	Latitude <sup>4</sup>	Longitude <sup>4</sup>	Map Sheet <sup>5</sup>	Comments
<b>Streams</b>									
Davis Creek	25-R-37	Perennial stream	23.4	0.34	628	40.95698376	-111.8946741	1	Fairly large channelized drainage that is designed and maintained to carry a lot of drainage waters including stormwater. Woody species near banks are mainly Russian olive. OHWM determined by staining on riprap and vegetation changes.
Steed Creek	25-R-36	Intermittent stream	5.5	0.38	2,387	40.96093274	-111.8931169	1, 3	Constructed channel designed with Legacy Parkway to mimic natural stream channel adjacent to roadway and paved trail. Lined with riprap. Lacks much vegetation. Dries out at times during summer. OHWM determined by staining on riprap. Drains into Davis Creek.
Farmington Creek	25-R-98	Perennial stream	18.5	0.75	1,599	40.96712444	-111.915793	4	Stream with a straightened channel that has a relatively narrow band of woody riparian vegetation with many large crack willows. Mostly just standing water observed during summer months, so could be considered intermittent. OHWM determined by shelving and vegetation changes. Drains into Farmington Bay.
Haight Creek	20-R-94	Perennial stream	8.4	0.46	1,893	40.99415901	-111.9390457	8	Channel runs mainly through grazed pasture and is not included on USGS maps as stream within survey area, but constructed channel is labeled as Haight Creek by Davis County. Channel is only a couple feet deep and essentially functions as a sizable drainage ditch. Mainly lacks a woody riparian component within the survey area. OHWM determined by vegetation changes near top of bank. Drains into emergent marsh that is part of the Great Salt Lake wetland complex.
Baer Creek	20-R-95	Perennial stream	10.8	0.20	841	40.99585568	-111.9431591	8	Stream with steep slopes has fairly robust woody riparian vegetation up-gradient, but this vegetation lessens in survey area to few trees. OHWM determined by vegetation changes. Drains into wetland that is part of the Great Salt Lake wetland complex.
Holmes Creek	17-R-92	Perennial stream	12.8	0.88	2,332	41.01734261	-111.9740591	12	Small stream that drains to the Great Salt Lake is highly channelized with steep, incised banks. Quite weedy along banks with about 10% cover by woody species (Russian olive, box elder, cottonwood, and willow). Herbaceous layer includes perennial pepperweed, yellow sweet clover, and teasel. OHWM determined by shelving and vegetation changes.
Kays Creek	16-R-77	Perennial stream	21.5	0.80	1,286	41.039785	-111.9997609	15	Stream that drains to the Great Salt Lake with OHWM determined by shelving and vegetation changes. Some fairly large trees along relatively steep banks (about 3:1 slope) observed in 2012 and 2013 (Russian olive, Siberian elm, and crack willow) have largely been removed by an unrelated project. Heavily grazed pasture lands adjacent to top of banks.

<i>Other Linear Water Features</i>									
	19-FD-30	Ditch/ drainage channel	8.0	0.09	465	40.95598578	-111.8936206	1	Starts out about 3 feet wide, then slowly widens out to nearly 15 feet. Drains into wetlands abutting Davis Creek. Russian olive along banks.
	19-FD-32	Ditch/ drainage channel	3.0	0.24	1,001	40.95300393	-111.8933597	1	Has ponded water from culvert under Legacy Parkway, then flows northwest. Contains some wetland vegetation.
	19-FD-33	Ditch/ drainage channel	5.0	0.09	594	40.95614961	-111.8940661	1	Drainage with flowing water observed during summer months.
	26-FD-15	Ditch/ drainage channel	13.0	0.37	1,149	40.95501086	-111.8901598	1	Drainage channel east of I-15 that appears to have regular flows.
	26-FD-71	Ditch/ drainage channel	3.0	0.01	169	40.95588765	-111.889421	1	Flows west into wetland 26-W-18.
	26-FD-77	Ditch/ drainage channel	3.0	0.01	106	40.95042518	-111.892313	1	Channel flows west under Legacy Parkway.
	26-FD-78	Ditch/ drainage channel	3.0	0.01	192	40.95066352	-111.892252	1	Vegetated ditch flows northwest to culvert under Legacy Parkway.
	25-FD-02	Ditch/ drainage channel	11.0	0.25	801	40.95960413	-111.8903693	1, 3	Large drainage channel just east of I-15 with some wetland vegetation.
	25-FD-72	Ditch/ drainage channel	5.0	0.02	86	40.96316588	-111.9048157	3	Channel that drains field into wetland 25-W-56.
	25-FD-80	Ditch/ drainage channel	3.0	0.01	88	40.96356639	-111.8921441	3	Flowing channel abuts wetland 25-W-35 and drains west under Legacy Parkway.

**Table 6-2. Other Delineated Aquatic Resources**

Name	Resource ID	Type	Average Width (ft.) <sup>1</sup>	Size (ac) <sup>2</sup>	Length (ft.) <sup>3</sup>	Latitude <sup>4</sup>	Longitude <sup>4</sup>	Map Sheet <sup>5</sup>	Comments
	25-FD-89	Drainage Channel	8.0	0.45	2,025	40.96021024	-111.9027104	3	Drainage channel between County Road (Sheep Lane) and the Denver & Rio Grande Western (D&RGW) rail line. Seems to maintain standing water into the summer and has some wetland vegetation in channel and within banks.
	25-FD-60	Ditch/ drainage channel	17.0	0.18	919	40.96478467	-111.9068945	4	Channel that seems to carry regular flows that may support abutting wetlands. Drains into Farmington Bay.
	25-FD-90	Drainage channel	14.0	0.10	367	40.96180974	-111.9059048	4	Segment of defined channel within wetland complex drainage that drains into emergent marsh 25-W-56A.
	24-FD-99	Ditch/ drainage channel	16.0	0.95	1,542	40.96777676	-111.9249054	4, 5	Large drainage canal that drains into Farmington Bay.
	22-FD-70	Drainage channel	18.0	0.42	1,718	40.97818712	-111.9362369	6	Large constructed drainage channel. Collects stormwater and appears to also capture flows from Shepard Creek. Drains into large open-water pond (22-OW-70). Emergent marsh 22-W-70 abuts this open channel within a broad swale-like drainage.
	22-FD-81	Drainage channel	7.0	0.13	869	40.98997534	-111.9371745	7	Stormwater drainage channel with flowing/standing water.
	20-FD-95	Ditch/ drainage channel	4.0	0.01	127	40.99595937	-111.9428915	8	Flowing ditch that empties into Baer Creek.
	18-FD-54	Drainage channel	14.0	0.26	655	41.00461931	-111.9562966	10	Wide stormwater drainage channel that drains into the Great Salt Lake wetlands complex.
	18-FD-94	Drainage channel	10.00	0.31	851	41.00832911	-111.9601119	10	Large stormwater drainage channel with a lot of wetland vegetation in channel and along banks.
	18-FD-93	Drainage channel	14.2	0.78	1,244	41.0119554	-111.9659983	10, 11	Relatively large drainage channel. Appears constructed to mimic a natural stream. Some reed canarygrass and saltcedar along banks.
	18-FD-58	Drainage swale	3.0	0.01	122	41.01220803	-111.9668188	11	Drainage swale channel that drains into feature 18-FD-93.
	18-FD-10	Ditch/ drainage channel	5.0	0.13	1,097	41.0155119	-111.9673268	12	Irrigation/drainage ditch that appears to at least maintain standing water.
	17-FD-91	Drainage channel	10.0	0.25	1,269	41.02604088	-111.9783532	13	Large drainage channel down-gradient from detention basin in neighborhood that drains to the Great Salt Lake.

<sup>4</sup> Degrees coordinates (WGS 84) provide the polygon centroid location for each delineated feature.

<sup>5</sup> See Appendix A, Aquatic Resource Delineation Map Series.

## 6.2.2 Constructed Features

Seventeen constructed features totaling 18.29 acres have been identified as constructed features that are believed to be exempt from jurisdiction. These areas include golf course water features (ponds and channels) and human-made water quality treatment facilities such as detention and retention basins that have been constructed in uplands. Other man-made or altered features that appear to have been constructed in wetlands or other aquatic sites have been included in Section 5.1. Table 6-3 provides specific information about each constructed feature.

**Table 6-3. Constructed Features**

Feature ID	Size (acres) <sup>1</sup>	Type	Latitude <sup>2</sup>	Longitude <sup>2</sup>	Map Sheet <sup>3</sup>

<sup>3</sup> See Appendix A, Aquatic Resource Delineation Map Series.

### 6.2.3 Irrigation and Roadway Drainage Features

The survey area contains numerous irrigation ditches, roadside stormwater drainage swales and ditches, and other channel-like features. Ditches and drainage channels that appear to be subject to jurisdiction under Section 404 of the CWA have been included as linear aquatic resources, as described in Section 5.1.2.

Some other ditches and channels exhibit a bed and bank but do not appear to carry a relatively permanent flow of water. Many of these features are ditches that are used to irrigate pasturelands and croplands. These ditches were observed as either routinely dry or carrying irrigation water some days and then drying out on other days during the growing season. Prominent ditches and channels lacking relatively permanent flow that are not believed to be subject to jurisdiction under Section 404 of the CWA are included on the maps in Appendix A as “Agricultural/Roadside Ditch.” These features are not included in report tables or the calculations for aquatic resources.

Other linear features are not included on the maps. These features include smaller field ditches and vegetated swales that typically do not exhibit a defined bed and bank or OHWM and do not have a predominance of hydrophytic vegetation.

## 6.3 Jurisdictional Status of Delineated Aquatic Resources

Most aquatic resources in the survey area appear to be connect to the Great Salt Lake, either through direct connection to the Great Salt Lake wetlands complex or as tributaries or waters adjacent to tributaries to the Great Salt Lake. Table 5-1 and Table 5-2 provide information on the locations and relationships of wetlands and other aquatic resources with other waters.

The Great Salt Lake is a traditional navigable waterbody (TNW). Therefore, under current guidance the USACE asserts jurisdiction over delineated wetlands that are adjacent to the Great Salt Lake (such as the lake’s wetland complex) and streams and other drainages that are relatively permanent non-navigable tributaries of the Great Salt Lake. The USACE also asserts jurisdiction over wetlands that directly abut relatively permanent non-navigable tributaries of TNW. If an approved jurisdictional determination is requested under current CWA guidance, the USACE would decide jurisdiction over wetlands that are adjacent but not abutting to relatively permanent non-navigable tributaries. Any wetlands adjacent to non-navigable tributaries that lack a significant nexus to a TNW or other wetlands that are determined to be isolated would not be subject to CWA jurisdiction.

## 7.0 Summary

HDR has conducted a delineation of all aquatic resources including wetlands within the survey area. All areas within the survey area were assessed to the degree necessary to determine the presence or absence of wetlands and resources per the guidelines established by USACE. One hundred ninety-six wetlands were delineated totaling 732.65 acres within the survey area. A separate report, West Davis Corridor Wetland Functional Assessment Report, describes methods and results of the functional assessment conducted for the delineated wetlands.

A total of 60.85 acres of other aquatic resources were delineated within the survey area as jurisdictional features and consist of seven streams (10,966 linear feet), 63 other linear water features (58,076 linear feet), and 14 open-water pond features (40.80 acres).

Wetland delineation data forms for the Arid West Supplement have been filled out for the areas that had potential wetland characteristics in accordance with USACE delineation procedures for the routine method. The data forms are included in Appendix B, Site Wetland Delineation Forms.

The jurisdictional status of delineated aquatic resources is subject to determination by USACE.

## 8.0 Additional Information

The following supporting information is included in the appendices to this technical memorandum:

- Appendix A – Aquatic Resource Delineation Map Series
- Appendix B – Wetland Delineation Forms
- Appendix C – On-site Representative Photographs
- Appendix D – List of Plant Species Observed
- Appendix E – NWI Map Series
- Appendix F – NRCS Soil Map Series
- Appendix G – NRCS Custom Soil Resource Report for West Davis Corridor
- Appendix H – Field Data Points

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project/Site: WDC Wetland Update City/County: Davis Sampling Date: 5/30/2017  
 Applicant/Owner: UDOT State: UT Sampling Point: MP-05302017-2-OUT-2  
 Investigators: M. Perkins Section, Township, Range: 16 4N 2W  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): Concave Slope(%): 2  
 Subregion (LRR): D - Western Range and Lat: 41.073116 Long: -112.070099 Datum: WGS84  
 Soil Map Unit Name: Ford loam, shallow water table, 0 to 1 percent slopes NWI Classification: PEM1A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No      (If No, explain in Remarks)  
 Are Vegetation:      Soil      or Hydrology      significantly disturbed? Are "Normal Circumstances" present? Yes X No       
 Are Vegetation:      Soil      or Hydrology      naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No <u>    </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>    </u> No <u>X</u>
Hydric Soil Present?	Yes <u>    </u>	No <u>X</u>	
Wetland Hydrology Present?	Yes <u>    </u>	No <u>X</u>	

Remarks:  
 Sampling within vicinity low point in swale feature is not a wetland. There are several nearby patches of Baltic rush that are situated above this point.

## VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: )	Absolute % Cover	Dominant Species?	Indicator Status	<b>Dominance Test Worksheet:</b> Number of Dominant Species That Are OBL, FACW, or FAC: <u>2</u> (A) Total Number of Dominant Species Across All Strata: <u>2</u> (B) Percent of Dominant Species That Are OBL, FACW, or FAC: <u>100.00000</u> (A/B)

 Investigators: M. Perkins Section, Township, Range: 21 4N 2W  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): Concave Slope(%): 1  
 Subregion (LRR): D - Western Range and Lat: 41.072742 Long: -112.068886 Datum: WGS84  
 Soil Map Unit Name: Ford loam, 0 to 1 percent slopes NWI Classification: PEM1/USA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No      (If No, explain in Remarks)  
 Are Vegetation:      Soil      or Hydrology      significantly disturbed? Are "Normal Circumstances" present? Yes X No       
 Are Vegetation:      Soil      or Hydrology      naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No <u>    </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>    </u> No <u>X</u>
Hydric Soil Present?	Yes <u>    </u>	No <u>X</u>	
Wetland Hydrology Present?	Yes <u>    </u>	No <u>X</u>	

Remarks:  
 Sampling in subtle broad swale dominated by Baltic rush. Pattern for this irrigated pasture is that the lowest depressions and swales meet all three wetland parameters while slightly higher areas, including areas dominated by rush and field sedge do not meet indicate hydric soils or wetland hydrology.

## VEGETATION – Use scientific names of plants.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project/Site: WDC Wetland Update City/County: Davis Sampling Date: 6/1/2017  
 Applicant/Owner: UDOT State: UT Sampling Point: MP-06012017-3-OUT-7  
 Investigators: M. Perkins Section, Township, Range: 05 4N 2W  
 Landform (hillslope, terrace, etc.): Footslope Local Relief (concave, convex, none): Convex Slope(%): 2  
 Subregion (LRR): D - Western Range and Lat: 41.104061 Long: -112.094330 Datum: WGS84  
 Soil Map Unit Name: Ford loam, shallow water table, 0 to 1 percent slopes NWI Classification: \_\_\_\_\_

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation: \_\_\_\_\_ Soil \_\_\_\_\_ or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes X No \_\_\_\_\_  
 Are Vegetation: \_\_\_\_\_ Soil \_\_\_\_\_ or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No <u>X</u>	<b>Is the Sampled Area within a Wetland?</b>	Yes _____ No <u>X</u>
Hydric Soil Present?	Yes _____	No _____		
Wetland Hydrology Present?	Yes _____	No _____		

Remarks:  
 Upland vegetation so no soil pit.

## VEGETATION – Use scientific names of plants.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project/Site: WDC Wetland Update City/County: Davis Sampling Date: 5/31/2017  
 Applicant/Owner: UDOT State: UT Sampling Point: MP-05312016-2-OUT-2  
 Investigators: M. Perkins Section, Township, Range: 16 4N 2W  
 Landform (hillslope, terrace, etc.): Valley Local Relief (concave, convex, none): Concave Slope(%): 1  
 Subregion (LRR): D - Western Range and Lat: 41.077518 Long: -112.072922 Datum: WGS84  
 Soil Map Unit Name: Ford loam, shallow water table, 0 to 1 percent slopes NWI Classification: PEM1A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No      (If No, explain in Remarks)  
 Are Vegetation:      Soil      or Hydrology      significantly disturbed? Are "Normal Circumstances" present? Yes X No       
 Are Vegetation:      Soil      or Hydrology      naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No <u>    </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>    </u> No <u>X</u>
Hydric Soil Present?	Yes <u>    </u>	No <u>X</u>	
Wetland Hydrology Present?	Yes <u>X</u>	No <u>    </u>	

Remarks:  
 Sampling point in low area of irrigated pasture is not a wetland. Areas to north and south are comprised of less promising vegetation (mainly dominated by meadow fescue).

## VEGETATION – Use scientific names of plants.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project/Site: WDC Wetland Update City/County: Davis Sampling Date: 5/23/2017  
 Applicant/Owner: UDOT State: UT Sampling Point: MP-05232017-2-OUT  
 Investigators: M. Perkins Section, Township, Range: 36 3N 1W  
 Landform (hillslope, terrace, etc.): Valley Local Relief (concave, convex, none): Convex Slope(%): 1  
 Subregion (LRR): D - Western Range and Lat: 40.954773 Long: -111.893761 Datum: WGS84  
 Soil Map Unit Name: Airport silt loam, 0 to 2 percent slopes NWI Classification: \_\_\_\_\_

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation: \_\_\_\_\_ Soil \_\_\_\_\_ or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes X No \_\_\_\_\_  
 Are Vegetation: \_\_\_\_\_ Soil \_\_\_\_\_ or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No _____	<b>Is the Sampled Area within a Wetland?</b> Yes _____ No <u>X</u>
Hydric Soil Present?	Yes _____	No <u>X</u>	
Wetland Hydrology Present?	Yes _____	No <u>X</u>	

Remarks:  
 Appears slightly higher than delineated wetland to west and north. Mixed vegetation passes but soils and hydrology do not.

## VEGETATION – Use scientific names of plants.

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No _____	Is the Sampled Area within a Wetland?	Yes _____ No <u>X</u>
Hydric Soil Present?	Yes _____	No <u>X</u>		
Wetland Hydrology Present?	Yes <u>X</u>	No _____		

Remarks:  
 Point neared location visited with USACE on 5/11/17. USACE agreed this mesic pasture is not a wetland because soils do not indicate hydric conditions and the vegetation community is not halophytic so soils are not considered problematic from high pH.

## VEGETATION – Use scientific names of plants.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project/Site: WDC Wetland Update City/County: Davis Sampling Date: 5/18/2017  
 Applicant/Owner: UDOT State: UT Sampling Point: MP-05182017-1-OUT-2  
 Investigators: M. Perkins Section, Township, Range: 31 3N 1E  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): Concave Slope(%): 1  
 Subregion (LRR): D - Western Range and Lat: 40.949001 Long: -111.890030 Datum: WGS84  
 Soil Map Unit Name: Ironton silt loam, 1 to 3 percent slopes NWI Classification: PEM1A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No      (If No, explain in Remarks)  
 Are Vegetation:      Soil      or Hydrology      significantly disturbed? Are "Normal Circumstances" present? Yes X No       
 Are Vegetation:      Soil      or Hydrology      naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <u>X</u>	No <u>    </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>    </u> No <u>X</u>
Hydric Soil Present?	Yes <u>    </u>	No <u>X</u>	
Wetland Hydrology Present?	Yes <u>X</u>	No <u>    </u>	

Remarks:  
 Point in area visited with USACE on 5/11/17 and all agreed sampling point is not a wetland because soils are do not fit any hydric indicators and the vegetation community does not suggest high pH. Field appears slightly higher to NW. Besides the other sampling point in this field with hydrophytic vegetation, most areas are currently really green but are not actually hydrophytic because they are dominated by meadow fescue with lower cover in wetland plants mixed in.

## VEGETATION – Use scientific names of plants.

 Applicant/Owner: UDOT State: UT Map/Sheet: 19 Sampling Point: 25-N-201207231153  
 Investigators: Trent Toler Section, Township, Range S 36 T 3 R 1  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): None Slope(%) 0  
 Subregion (LRR): LRR D Lat: 40.957836209 Long: -111.894214692 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Draper loam, 0 to 1 percent slopes NWI Classification: \_\_\_\_\_  
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, significantly disturbed? Are "Normal Circumstances" present? Yes X No \_\_\_\_\_  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____ No <u>X</u>	Is the Sampled Area within a Wetland? Yes _____ No <u>X</u>
Hydric Soil Present?	Yes _____ No <u>X</u>	
Wetland Hydrology Present?	Yes _____ No <u>X</u>	
Wetland ID: _____		

Remarks:  
 Sample Area in upland pasture with small Russian olive grove.

## VEGETATION - Use scientific names of plants.

### Tree Stratum

### Shrub Stratum

### Herb Stratum (Plot size: 30 Ft )

	<u>Absolute % Cover</u>	<u>Dominant Species</u>	<u>Indicator Status</u>
<u>Festuca pratensis</u>	<u>70</u>	<u>Y</u>	<u>FACU</u>

Depth (inches): \_\_\_\_\_

Hydric Soil Present? Yes X No \_\_\_\_\_

Remarks:  
At 11-12 in, band of 10YR 2/1 matrix w/ same redox.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1) (Nonriverine)
- ☐ Sediment Deposits (B2) (Nonriverine)
- ☐ Drift Deposits (B3) (Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Fauna (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☒ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Thin Muck Surface (C7)
- ☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☐ Water Marks (B1) (Riverine)
- ☐ Sediment Deposits (B2) (Riverine)
- ☐ Drift Deposits (B3) (Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imag.(C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present?

Yes \_\_\_\_\_ No X

Depth (inches):

\_\_\_\_\_

Water Table Present?

Yes \_\_\_\_\_ No X

Depth (inches):

\_\_\_\_\_

Saturation Present?

Yes X No \_\_\_\_\_

Depth (inches):

19

(includes capillary fringe)

Wetland Hydrology Present? Yes X No \_\_\_\_\_

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:  
Water table is likely low due to the season, much wetter within wetland just to west.

Meets F7 and F3 indicators.

HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one is required; check all that apply)

☐ Surface Water (A1)☐ High Water Table (A2)☒ Saturation (A3)☐ Water Marks (B1) (Nonriverine)☐ Sediment Deposits (B2) (Nonriverine)☐ Drift Deposits (B3) (Nonriverine)☐ Surface Soil Cracks (B6)☐ Inundation Visible on Aerial Imagery (B7)☐ Water-Stained Leaves (B9)☐ Salt Crust (B11)☐ Biotic Crust (B12)☒ Aquatic Fauna (B13)☐ Hydrogen Sulfide Odor (C1)☐ Oxidized Rhizospheres along Living Roots (C3)☐ Presence of Reduced Iron (C4)☐ Recent Iron Reduction in Tilled Soils (C6)☐ Thin Muck Surface (C7)☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

☐ Water Marks (B1) (Riverine)☐ Sediment Deposits (B2) (Riverine)☐ Drift Deposits (B3) (Riverine)☐ Drainage Patterns (B10)☐ Dry-Season Water Table (C2)☐ Crayfish Burrows (C8)☐ Saturation Visible on Aerial Imag.(C9)☐ Shallow Aquitard (D3)☒ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present?      Yes ☐ No ☒      Depth (inches): 

--

Water Table Present?      Yes ☒ No ☐      Depth (inches): 

14

Saturation Present?      Yes ☒ No ☐      Depth (inches): 

10

(includes capillary fringe)

**Wetland Hydrology Present?**      Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Water table may be higher (pit not observed very long).

US Army Corps of Engineers

Arid West – Version 2.0

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project Site: West Davis Corridor City/County: Davis County Sampling Date: 7/23/2012  
 Applicant/Owner: UDOT State: UT Map/Sheet: 19 Sampling Point: 26-W-201207231000  
 Investigators: Donovan Gross Nate Nichols Section, Township, Range S 36 T 3 R 1  
 Landform (hillslope, terrace, etc.): Basin Local Relief (concave, convex, none): Concave Slope(%) 20  
 Subregion (LRR): LRR D Lat: 40.9488881508 Long: -111.892210108 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Airport silt loam, 0 to 2 percent slopes NWI Classification: PEMC

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No        (If No, explain in Remarks)  
 Are Vegetation       , Soil       , Hydrology       , significantly disturbed? Are "Normal Circumstances" present? Yes X No         
 Are Vegetation       , Soil       , Hydrology X, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <u>X</u> No <u>      </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>X</u> No <u>      </u> <b>Wetland ID:</b> <u>26-W-32</u>
Hydric Soil Present? Yes <u>X</u> No <u>      </u>	
Wetland Hydrology Present? Yes <u>      </u> No <u>X</u>	

Remarks:  
 Sample point determined to be a wetland with hydrophytic vegetation and hydric soils. Hydrology assumed during wetter portion of growing season.

## VEGETATION— Use scientific names of plants.

	<u>Absolute % Cover</u>	<u>Dominant Species</u>	<u>Indicator Status</u>
<u>Tree Stratum</u>			
<u>Shrub Stratum</u>			
<u>Herb Stratum</u> (Plot size: <u>30 Ft</u> )			
Juncus arcticus	40	Y	FACW
Distichlis spicata	20	Y	FAC
Hordeum jubatum	20	Y	FAC
Hordeum pusillum	10	N	FACU
	90	=Total Cover	
<u>Vine Stratum</u>			

### Dominance Test Worksheet:

Number of Dominant Species That are OBL, FACW, or FAC: 3 (A)  
 Total Number of Dominant Species Across all Strata: 3 (B)  
 Percent of Dominant Species That are OBL, FACW, or FAC: 100.0% (A/B)

### Prevalence Index Worksheet:

Total % Cover of:	Multiply by:
OBL species <u>0</u>	x 1 = <u>0</u>
FACW species <u>40</u>	x 2 = <u>80</u>
FAC species <u>40</u>	x 3 = <u>120</u>
FACU species <u>10</u>	x 4 = <u>40</u>
UPL species <u>0</u>	x 5 = <u>0</u>
Column Totals: <u>90</u> (A)	<u>240</u> (B)

Prevalence Index = B/A = 2.67

### Hydrophytic Vegetation Indicators:

Rapid Test for Hydrophytic Vegetation  
X Dominance Test > 50%  
X Prevalence Index ≤ 3.0  
       Morphological Adaptations (Provide supporting data in Remarks or on a separate sheet)  
       Problematic Hydrophytic Vegetation (Explain)  
 Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No       

% Bare Ground in Herb Stratum 5 % Cover of Biotic Crust       

Remarks: (Include photo numbers here or on a separate sheet.)

Vegetation is hydrophytic.

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

Depth (inches)	Matrix			Redox Features				Texture	Remarks
	Color (moist)		%	Color (moist)	%	Type <sup>1</sup>	Loc <sup>2</sup>

 Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, significantly disturbed? Are "Normal Circumstances" present? Yes X No \_\_\_\_\_  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____ No <u>X</u>	<b>Is the Sampled Area within a Wetland?</b> Yes _____ No <u>X</u> Wetland ID: _____
Hydric Soil Present?	Yes _____ No <u>X</u>	
Wetland Hydrology Present?	Yes _____ No <u>X</u>	

Remarks:  
 Sampling point is an upland.

## VEGETATION— Use scientific names of plants.

(includes capillary fringe)

**Wetland Hydrology Present?** Yes X No \_\_\_\_\_

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

## Remarks:

Both indicators high water table and saturation indicate wetland hydrology. Hydrology source of wetland is a drainage emptying into wetland on the north side; likely stormwater and irrigation return water, along with irrigation run-off from adjacent development.

**Field Observations:**

Surface Water Present?	Yes _____ No <u>X</u>	Depth (inches):	_____
Water Table Present?	Yes _____ No <u>X</u>	Depth (inches):	_____
Saturation Present?	Yes _____ No <u>X</u>	Depth (inches):	_____

(includes capillary fringe)

**Wetland Hydrology Present?** Yes \_\_\_\_\_ No X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

## Remarks:

Soil damper near surface (still not saturated); suggests irrigation confoundment.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project Site: West Davis Corridor City/County: Davis County Sampling Date: 4/29/2013  
 Applicant/Owner: UDOT State: UT Map/Sheet: 10 Sampling Point: 17-N-201304291113  
 Investigators: Nate Nichols Mike Perkins Section, Township, Range S 25 T 4 R 2  
 Landform (hillslope, terrace, etc.): Depression Local Relief (concave, convex, none): None Slope(%) 0  
 Subregion (LRR): LRR D Lat: 41.020750 Long: -111.972747 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Logan silty clay loam, 0 to 3 percent slopes NWI Classification: \_\_\_\_\_

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, significantly disturbed? Are "Normal Circumstances" present? Yes X No \_\_\_\_\_  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes _____ No <u>X</u>	<b>Is the Sampled Area within a Wetland?</b> Yes _____ No <u>X</u> <b>Wetland ID:</b> _____
Hydric Soil Present? Yes _____ No <u>X</u>	
Wetland Hydrology Present? Yes _____ No <u>X</u>	

Remarks:  
 Non-wetland sampling point slightly higher than nearby wetland point. Adjacent field to east is higher in elevation with increasing fescue.

## VEGETATION— Use scientific names of plants.

**Absolute % Cover** **Dominant Species** **Indicator Status**

Number of Dominant Species That are OBL, FACW, or FAC: 3 (A)

Total Number of Dominant Species Across all Strata: 3 (B)

Percent of Dominant Species That are OBL, FACW, or FAC: 100.0% (A/B)

### Prevalence Index Worksheet:

Total % Cover of:	Multiply by:
OBL species <u>50</u>	x 1 = <u>50</u>
FACW species <u>15</u>	x 2 = <u>30</u>
FAC species <u>0</u>	x 3 = <u>0</u>
FACU species <u>20</u>	x 4 = <u>80</u>
UPL species <u>0</u>	x 5 = <u>0</u>
Column Totals: <u>85</u> (A)	<u>160</u> (B)

Prevalence Index = B/A = 1.88

### Hydrophytic Vegetation Indicators:

       Rapid Test for Hydrophytic Vegetation  
X Dominance Test > 50%  
X Prevalence Index ≤ 3.0  
       Morphological Adaptations (Provide supporting data in Remarks or on a separate sheet)  
       Problematic Hydrophytic Vegetation (Explain)  
 Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No       

% Bare Ground in Herb Stratum 5 % Cover of Biotic Crust       

Remarks: (Include photo numbers here or on a separate sheet.)

Vegetation is hydrophytic.

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

Depth (inches)	Matrix			Redox Features				Texture	Remarks
	Color (moist)		%	Color (moist)	%	Type <sup>1</sup>	Loc <sup>2</sup>

Arid West – Version 2.0

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project Site: West Davis Corridor City/County: Davis County Sampling Date: 6/12/2012  
 Applicant/Owner: UDOT State: UT Map/Sheet: 11 Sampling Point: 18-W-201206121036  
 Investigators: Trent Toler Mike Perkins Section, Township, Range S 9 T 3 R 1  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): Concave Slope(%) 10  
 Subregion (LRR): LRR D Lat: 41.0156695203 Long: -111.967211814 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Airport silt loam, 0 to 2 percent slopes NWI Classification: \_\_\_\_\_

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No \_\_\_\_\_ (If No, explain in Remarks)  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology X, significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No X  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, Hydrology \_\_\_\_\_, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <u>X</u> No _____	<b>Is the Sampled Area within a Wetland?</b> Yes <u>X</u> No _____ <b>Wetland ID:</b> <u>18-W-92</u>
Hydric Soil Present? Yes _____ No <u>X</u>	
Wetland Hydrology Present? Yes <u>X</u> No _____	

Remarks:  
 Area does NOT meet wetland criteria. Strong evidence of past inundated and anaerobic conditions, but recent development and fill dumping to the east may not be restricting hydrology to this site. Since this borderline marsh is still connected to bulrush marsh to the northwest, this area will be considered also a wetland.

## VEGETATION— Use scientific names of plants.

☐ Sandy Redox (S5)☐ Stripped Matrix (S6)☐ Loamy Mucky Mineral (F1)☐ Loamy Gleyed Matrix (F2)☐ Depleted Matrix (F3)☐ Redox Dark Surface (F6)☐ Depleted Dark Surface (F7)☐ Redox Depressions (F8)☐ Vernal Pools (F9)

**Indicators for Problematic Hydric Soils: <sup>3</sup>**

☐ 1 cm Muck (A9) (LRR C)☐ 2 cm Muck (A10) (LRR B)☐ Reduced Vertic (F18)☐ Red Parent Material (TF2)☐ Other (Explain in Remarks)

<sup>3</sup> Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

☐ **Restrictive Layer (if observed):**

Type: Depth (inches):

Hydric Soil Present?

Yes ☒ No ☐

Remarks:

Hydrogen Sulfide odor there but not real strong, otherwise just dark soils.

HYDROLOGY

**Wetland Hydrology Indicators:**

Primary Indicators (minimum of one is required; check all that apply)

☐ Surface Water (A1)☒ High Water Table (A2)☒ Saturation (A3)☐ Water Marks (B1) (Nonriverine)☐ Sediment Deposits (B2) (Nonriverine)☐ Drift Deposits (B3) (Nonriverine)☐ Surface Soil Cracks (B6)☐ Inundation Visible on Aerial Imagery (B7)☐ Water-Stained Leaves (B9)

☐ Salt Crust (B11)☐ Biotic Crust (B12)☐ Aquatic Fauna (B13)☐ Hydrogen Sulfide Odor (C1)☐ Oxidized Rhizospheres along Living Roots (C3)☐ Presence of Reduced Iron (C4)☐ Recent Iron Reduction in Tilled Soils (C6)☐ Thin Muck Surface (C7)☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

☐ Water Marks (B1) (Riverine)☐ Sediment Deposits (B2) (Riverine)☐ Drift Deposits (B3) (Riverine)☐ Drainage Patterns (B10)☐ Dry-Season Water Table (C2)☐ Crayfish Burrows (C8)☐ Saturation Visible on Aerial Imag.(C9)☐ Shallow Aquitard (D3)☒ FAC-Neutral Test (D5)

**Field Observations:**

Surface Water Present?

Yes ☐ No ☒

Depth (inches):

Water Table Present?

Yes ☒ No ☐

Depth (inches):

Saturation Present?

Yes ☒ No ☐

Depth (inches):

(includes capillary fringe)

Wetland Hydrology Present?

Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Surface saturation might be from irrigation tail water coming from up slope; uplands wet too.

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project Site: West Davis Corridor City/County: Davis County Sampling Date: 6/5/2012  
 Applicant/Owner: UDOT State: UT Map/Sheet: 7 Sampling Point: 15-W-201206051315  
 Investigators: Trent Toler Section, Township, Range S 31 T 4 R 1  
 Landform (hillslope, terrace, etc.): Basin Local Relief (concave, convex, none): Concave Slope(%) 1  
 Subregion (LRR): LRR D Lat: 41.0443762389 Long: -112.006599005 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Warm Springs fine sandy loam, 0 to 1 percent slopes NWI Classification: PEMC  
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No        (If No, explain in Remarks)  
 Are Vegetation       , Soil       , Hydrology       , significantly disturbed? Are "Normal Circumstances" present? Yes        No X  
 Are Vegetation       , Soil       , Hydrology X, naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <u>X</u> No <u>      </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>X</u> No <u>      </u> Wetland ID: <u>15-W-98</u>
Hydric Soil Present? Yes <u>X</u> No <u>      </u>	
Wetland Hydrology Present? Yes <u>X</u> No <u>      </u>	

Remarks:  
 Low depression, probably gets irrigation overflow or other runoff.

Arid West – Version 2.0

# WETLAND DETERMINATION DATA FORM - Arid West Region

Project Site: West Davis Corridor City/County: Davis County Sampling Date: 6/6/2012  
 Applicant/Owner: UDOT State: UT Map/Sheet: 7 Sampling Point: 15-W-201206061059  
 Investigators: Trent Toler Section, Township, Range S 31 T 4 R 1  
 Landform (hillslope, terrace, etc.): Flat Local Relief (concave, convex, none): Concave Slope(%) 1  
 Subregion (LRR): LRR D Lat: 41.0439665706 Long: -112.006910492 Datum: GCS\_WGS\_1984  
 Soil Map Unit Name: Warm Springs fine sandy loam, 0 to 1 percent slopes NWI Classification: PEMC  
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No        (If No, explain in Remarks)  
 Are Vegetation       , Soil       , Hydrology       , significantly disturbed? Are "Normal Circumstances" present? Yes        No X  
 Are Vegetation       , Soil       , Hydrology       , naturally problematic? (If needed, explain any answers in Remarks.)

## SUMMARY OF FINDINGS - Attach a site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <u>X</u> No <u>      </u>	<b>Is the Sampled Area within a Wetland?</b> Yes <u>X</u> No <u>      </u> Wetland ID: <u>15-W-12</u>
Hydric Soil Present? Yes <u>X</u> No <u>      </u>	
Wetland Hydrology Present? Yes <u>X</u> No <u>      </u>	

Remarks:  
 Wet meadow with a patchy mix of spp. Gently slopes towards GSL.

## VEGETATION— Use scientific names of plants.

	<u>Absolute % Cover</u>	<u>Dominant Species</u>	<u>Indicator Status</u>
<u>Tree Stratum</u>			
<u>Shrub Stratum</u>			
<u>Herb Stratum</u> (Plot size: <u>30 Ft</u> )			
Juncus arcticus	30	Y	FACW
Hordeum jubatum	20	Y	FAC
Carex praegracilis	15	Y	FACW
Distichlis spicata	15	Y	FAC
Festuca pratensis	10	N	FACU
Schoenoplectus pungens	10	N	OBL
	100	=Total Cover	

### Dominance Test Worksheet:

Number of Dominant Species That are OBL, FACW, or FAC: 4 (A)  
 Total Number of Dominant Species Across all Strata: 4 (B)  
 Percent of Dominant Species That are OBL, FACW, or FAC: 100.0% (A/B)

### Prevalence Index Worksheet:

Total % Cover of:	Multiply by:
OBL species <u>10</u>	x 1 = <u>10</u>
FACW species <u>45</u>	x 2 = <u>90</u>
FAC species <u>35</u>	x 3 = <u>105</u>
FACU species <u>10</u>	x 4 = <u>40</u>
UPL species <u>0</u>	x 5 = <u>0</u>
Column Totals: <u>100</u> (A)	<u>245</u> (B)

Prevalence Index = B/A = 2.45

### Hydrophytic Vegetation Indicators:

Rapid Test for Hydrophytic Vegetation  
X Dominance Test > 50%  
X Prevalence Index ≤ 3.0  
 Morphological Adaptations (Provide supporting data in Remarks or on a separate sheet)  
 Problematic Hydrophytic Vegetation (Explain)  
 Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes X No       

% Bare Ground in Herb Stratum 0 % Cover of Biotic Crust

Remarks: (Include photo numbers here or on a separate sheet.)

Patchy mix of species, but most FAC or better.

**Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)**

Depth (inches)	Matrix		Redox Features				Texture	Remarks
